

# **Rationale for the use of Single Pill Combination (SPC) and Asian data of ARB/CCB SPC**

**Seung Woo Park, MD**

**Samsung Medical Center**

# BP Control Rates in Asia

**Turkey<sup>1</sup>**  
(Treated population)

**Thailand<sup>2</sup>**  
(Treated population)

**China<sup>3</sup>**  
(Population aware of their hypertension)

BP = blood pressure

<sup>1</sup>Erem et al. J Public Health 2009;31:47–58

<sup>2</sup>Aekplakorn et al. J Hypertens 2008;26:191–8

<sup>3</sup>Wu et al. Circulation 2008;118:2679–86

# Agents with a Single Mechanism of Action: *Limitations*

Materson et al. observed that antihypertensive agents with a single MoA were inadequate to achieve a diastolic BP <95 mmHg in 40–60% of hypertensive patients<sup>1</sup>

Because hypertension is a multifactorial disease, in most cases at least two antihypertensive agents are needed for patients to achieve BP goal<sup>2</sup>

As an estimate, one-third of patients with hypertension require 2 drugs to achieve BP control\* and one-third of patients will require 3 or more antihypertensive agents to achieve BP control<sup>3</sup>

\*Blood pressure (BP) <140/90 mmHg

<sup>1</sup>Materson et al. N Engl J Med 1993;328:914–21

<sup>2</sup>Milani. Am J Manag Care 2005;11:S220–7

<sup>3</sup>Düsing et al. Vasc Health Risk Manag 2010;6:321–5

## **Multiple-mechanism Therapy:** *Potential Efficacy Benefits*

Components with a different mechanism of action interact on complementary pathways of BP control<sup>1</sup>

Each component can potentially neutralize counter-regulatory mechanisms

Multiple-mechanism therapy may result in BP reductions that are additive<sup>2</sup>

<sup>1</sup>Sica. *Drugs* 2002;62:443–62

<sup>2</sup>Quan et al. *Am J Cardiovasc Drugs* 2006;6:103–13

# Adding an Antihypertensive Agent *More Effective Than Titrating*

**Conclusions from a meta-analysis comparing combination antihypertensive therapy with monotherapy in over 11,000 patients from 42 trials**

Wald et al. Am J Med 2009;122:290-300

# ACCOMPLISH Study

## *Target achieved with Multiple Mechanism Therapy*

Only ~37% of patients had their BP controlled at baseline despite ~74% of patients receiving  $\geq 2$  antihypertensive agents as free combination

\*Control defined as BP <140/90 mmHg

<sup>‡</sup>Values calculated from mean BP after titration and mean BP control rate over the duration of the study

ACCOMPLISH = Avoiding Cardiovascular events through COMbination therapy in Patients Living with Systolic Hypertension; HCTZ = hydrochlorothiazide

Jamerson et al. N Engl J Med 2008;359:2417–28  
Jamerson et al. Presented at ACC 2008

# Multiple-mechanism Therapy: *Potential Tolerability Benefits*

**Multiple-mechanism therapy may have an improved tolerability profile compared with its single-mechanism components<sup>1,2</sup>**

Components of multiple-mechanism therapy can be given at lower dosages to achieve blood pressure goal than those required as monotherapy →

- Better tolerated
- Attenuated compound-specific adverse events  
ex) RAAS blockers may attenuate the edema that is caused by CCB

<sup>1</sup>Sica. Drugs 2002;62:443–62

<sup>2</sup>Quan et al. Am J Cardiovasc Drugs 2006;6:103–13

# Multiple-mechanism Therapy: *Reducing Adverse Effects*

## *Combination Therapy Meta-Analysis*

\* $P < 0.03$  combination therapy vs expected additive effect (ie, doubling monotherapy result)

# European Guidelines now Recommend *Use of Single-pill Combination Therapy*

2009 European guidelines state:

*'The combination of two antihypertensive drugs may offer advantages also for treatment initiation, particularly in patients at high cardiovascular risk in which early BP control may be desirable'*

*'Whenever possible, use of fixed dose (or single pill) combinations should be preferred, because simplification of treatment carries advantages for compliance to treatment'*

# HTN patients by severity degree

*More than 40 % of patients are suffered from stage 2 or 3*

Treated HTN-patients by severity degree (in % of patients)

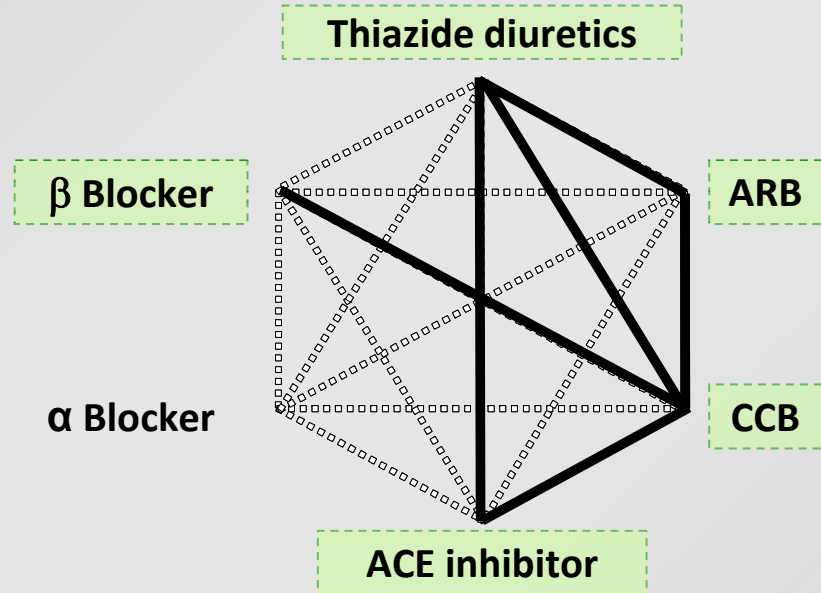

*Data Source) Global CV HTN Tracker study (Nov, 2008)*

# 2007 ESH/ESC Guidelines: *Possible Combinations*

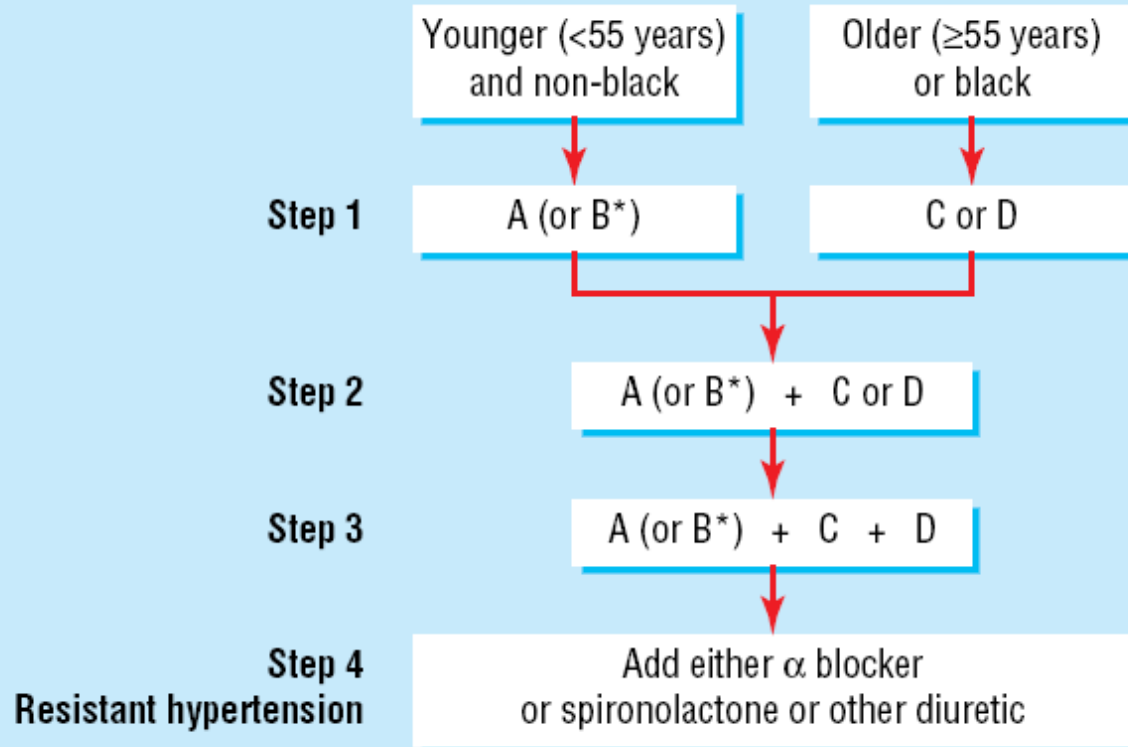

## 2003 ESH-ESC

## 2007 ESH-ESC

# AB/CD rule

A: ACE inhibitor or angiotensin receptor blocker

B:  $\beta$  blocker

C: Calcium channel blocker

D: Diuretic (thiazide and thiazide-like)

\* Combination therapy involving B and D may induce more new onset diabetes compared with other combination therapies

# Current treatment pattern: *Still many patients need more than 2 agents*

\*Combination Therapy = Free combination + SPC (Single Pill Combination)

## Non-persistence with Antihypertensive Therapy *Increased Risk of Myocardial Infarction and Stroke*

Data based on 77,193 new users of antihypertensive treatment identified in the PHARMO record linkage system

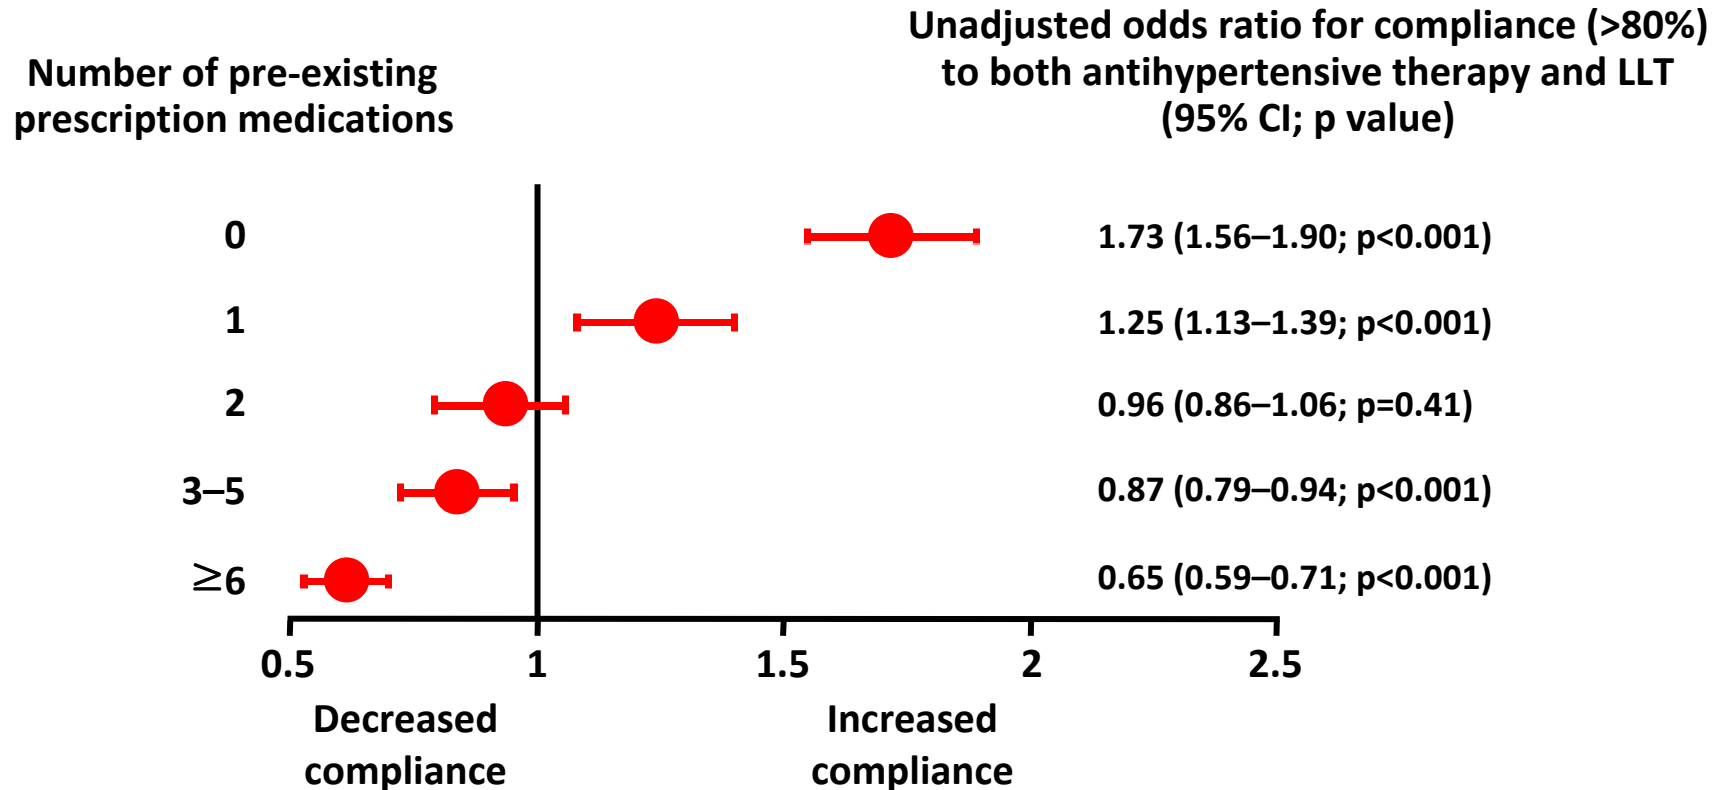

\*Adjusted for gender, age, type of prescriber, use of cardiovascular co-medication, initial antihypertensive therapy, number of different antihypertensive classes during the first 2 years of therapy

## Adherence to Antihypertensives and CV Morbidity Among 18,806 Newly Diagnosed Hypertensive Patients

Adherence Within 6 mo After Diagnosis	HR* (95% CI)	<i>P</i>
Model 1†		
Low (PDC <40%)	1.00	<0.001§
Intermediate (PDC, 40% to 79%)	0.87 (0.73–1.03)	0.117
High (PDC ≥80%)	0.50 (0.35–0.69)	<0.001
Model 2†		
Low (PDC <40%)	1.00	<0.001§
Intermediate (PDC, 40% to 79%)	0.86 (0.71–1.03)	0.109
High (PDC ≥80%)	0.62 (0.40–0.96)	0.032

# Compliance Decreases *as the Number of Medications Increases*

Retrospective cohort study of MCO population. N=8,406 patients with hypertension who added antihypertensive therapy and LLT to existing prescription medications within a 90-day period. Compliance to concomitant therapy: sufficient antihypertensive and LL prescription medications to cover  $\geq 80\%$  of days per 91-day period  
CI=confidence interval; LLT = lipid-lowering therapy

# Fixed dose combination Combinations: *Advantages Vs. Free Combinations*

	FDC	Free Combination
Simplicity of treatment <sup>1,2</sup>	+	–
Adherence <sup>1,2</sup>	+	–
Efficacy <sup>2</sup>	+	+
Tolerability <sup>2</sup>	+*	–
Price <sup>2</sup>	+	–
Flexibility <sup>2</sup>	+**	++

\*Lower doses generally used in FDCs

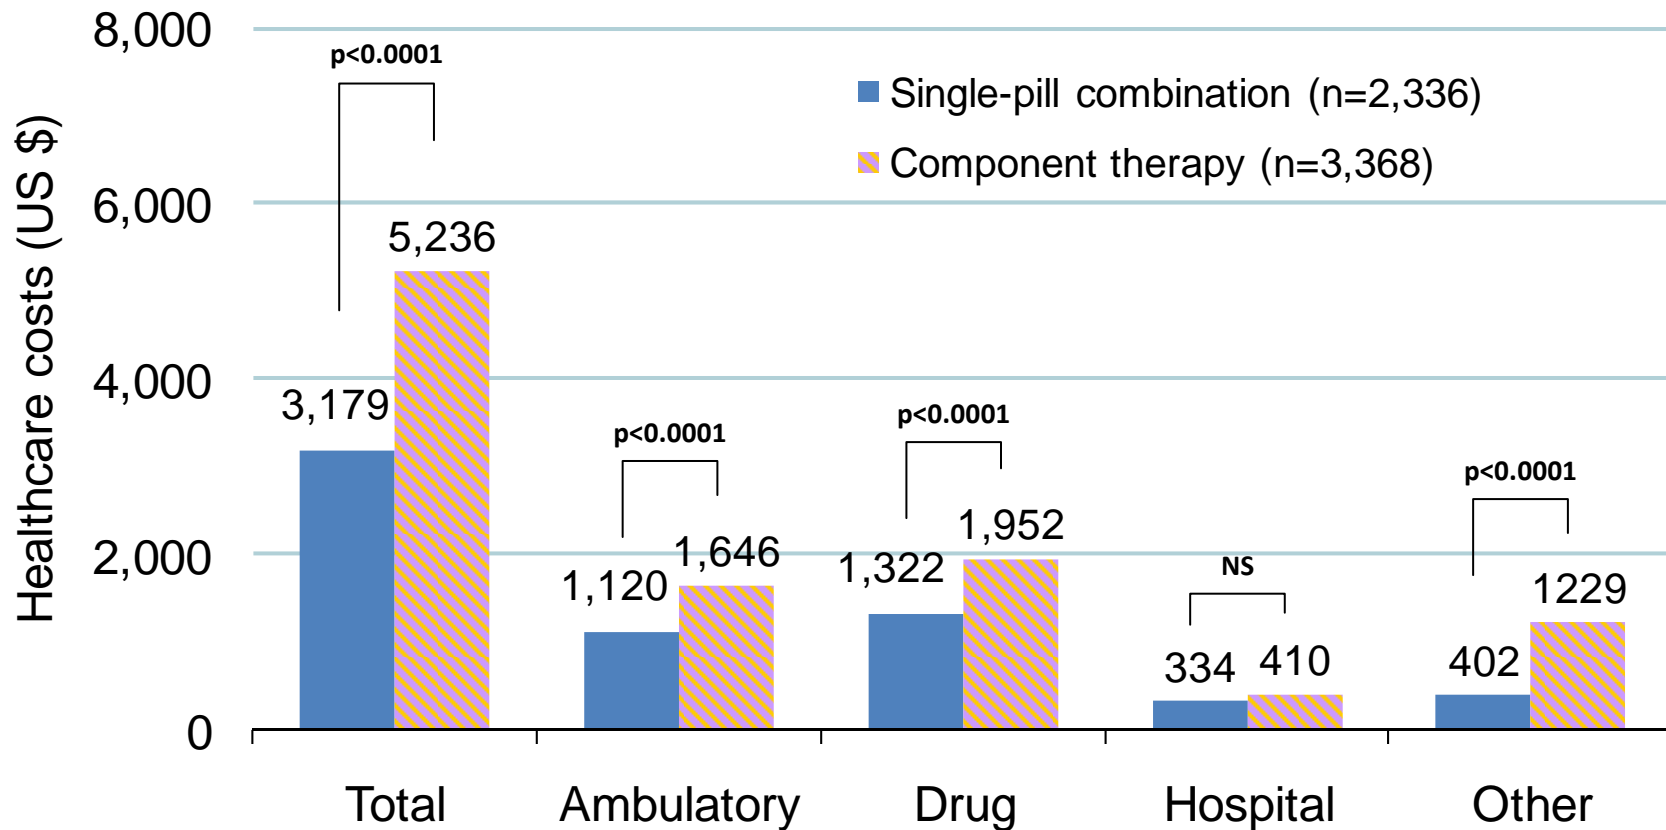

\*\*An increasing number of FDCs are becoming available with a range of doses

+ = potential advantage

<sup>2</sup>Neutel. Hypertension. Companion to Brenner & Rector's The Kidney. 2<sup>nd</sup> ed. Philadelphia: Elsevier Saunders, 2005. p. 522–9

# Patients Treated with Fixed dose Combinations: *Use Less Resource*

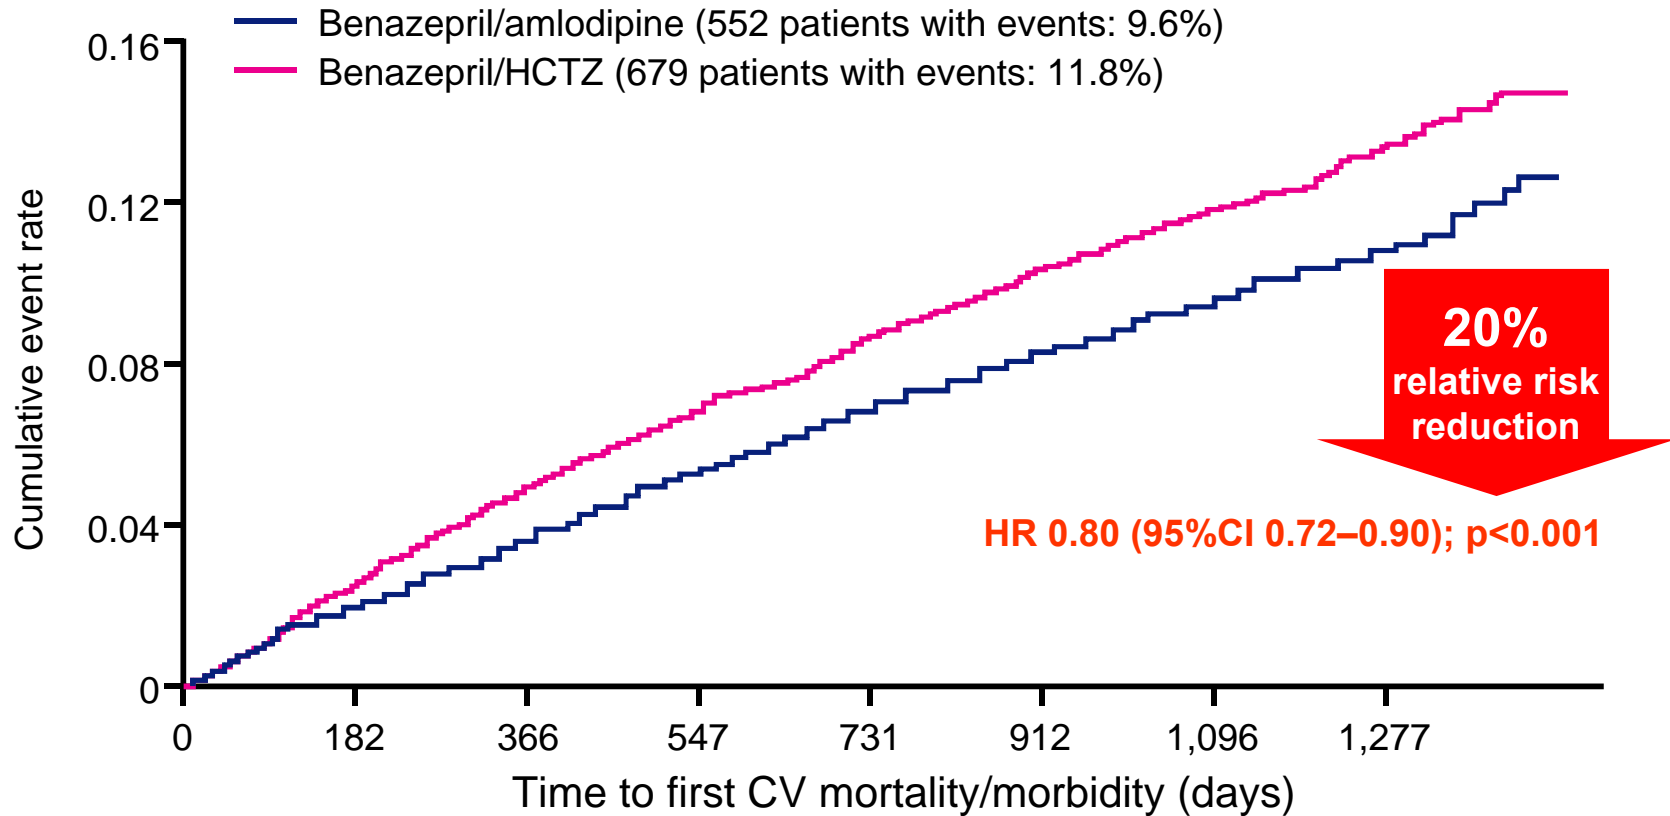

NS = not significant

**Which Single-pill Combinations?**

# ACCOMPLISH:

## Superior CV Outcomes with RAAS Blocker/Amlodipine Vs. RAAS Blocker/HCTZ

Months	0	6	12	18	24	30	36	42
Patients at risk (N)								
Benazepril/amlodipine	5,512	5,317	5,141	4,959	4,739	2,826	1,447	
Benazepril/HCTZ	5,483	5,274	5,082	4,892	4,655	2,749	1,390	

ACCOMPLISH = Avoiding Cardiovascular events through COMbination therapy in Patients Living with Systolic Hypertension; CV = cardiovascular; RAAS = renin-angiotensin-aldosterone system; HCTZ = hydrochlorothiazide

Jamerson et al. N Engl J Med 2008;359:2417–28

# Amlodipine

## *Wealth of Cardiovascular Outcomes Data*

### PREVENT<sup>1</sup>

825 coronary heart disease (CAD) patients ( $\geq 30\%$ ):  
Multicentre, randomized, placebo controlled

Primary outcome: No difference in mean 3 yr coronary angiographic changes vs placebo

35% ↓ hospitalization for HF + angina

43% ↓ revascularization procedures

### CAMELOT<sup>2</sup>

1,991 CAD patients ( $>20\%$ ): Double-blind,  
randomized study vs placebo and enalapril 20 mg

Primary outcome: 31% ↓ in CV events vs placebo

42% ↓ hospitalization for angina

27% ↓ coronary revascularization

### ASCOT-BPLA/CAFE<sup>3,4</sup>

19,257 hypertensive patients: Multicentre,  
randomized, prospective study vs atenolol

Primary outcome: 10% ↓ in non-fatal MI & fatal CHD

16% ↓ total CV events and procedures

30% ↓ new-onset diabetes

23% ↓ stroke

11% ↓ all-cause mortality

↓ central aortic pressure by 4.3 mmHg

### ALLHAT<sup>5</sup>

18,102 hypertensive patients: Randomized,  
prospective study vs lisinopril

Primary outcome: No difference in composite of fatal CHD + non-fatal MI vs lisinopril

6% ↓ combined CV disease

23% ↓ stroke

<sup>4</sup>Williams et al. Circulation 2006;113:1213–25; <sup>5</sup>Leenen et al. Hypertension 2006;48:374–84

# ARB

## *Wealth of Cardiovascular Outcomes Data*

### VALUE<sup>1</sup>

15,245 high-risk hypertension patients; Double-blind, randomized study vs amlodipine

No difference in composite of cardiac mortality and morbidity (primary)

23% ↓ new-onset diabetes

### VALIANT<sup>2</sup>

14,703 post-myocardial infarction (MI) patients; Double-blind, randomized study vs captopril and vs captopril + valsartan

No difference vs captopril in all-cause mortality (primary)

(valsartan is as effective as standard of care)

### Val-HeFT<sup>3-5</sup>

5,010 heart failure (HF) II-IV patients; Double-blind, randomized study vs placebo

13% ↓ morbidity and mortality (primary)

↓ left ventricular remodeling

37% ↓ atrial fibrillation occurrence

↓ HF signs/symptoms

28% ↓ HF hospitalization

### JIKEI HEART<sup>6</sup>

3,081 Japanese patients on conventional treatment for hypertension, coronary heart disease (CHD), HF or combination of these; Multicentre, randomized, controlled trial comparing addition of valsartan vs non-angiotensin Type 2 receptor blocker (ARB) to conventional treatment

39% ↓ composite CV mortality and morbidity

40% ↓ Stroke/transient ischemic attack (TIA)

47% ↓ Hospitalization for HF

65% ↓ Hospitalization for angina

### KYOTO HEART<sup>7</sup>

3,031 Japanese patients on conventional treatment for hypertension and high CV risk; Multicentre PROBE trial comparing addition of valsartan vs non-ARB to conventional treatment

45% ↓ composite CV mortality and morbidity

45% ↓ Stroke/transient ischemic attack (TIA)

49% ↓ Angina pectoris

33% ↓ New-onset diabetes

## Powerful BP Reductions Across Hypertension (HTN) Severities

<sup>1</sup>DBP 90–99 mmHg, SBP 140–159 mmHg

<sup>†</sup>DBP ≥ 100 mmHg, SBP ≥ 160 mmHg

BP = blood pressure; DBP = diastolic BP;

SBP = systolic BP; MSSBP = mean sitting SBP

<sup>1</sup>Smith et al. J Clin Hypertens 2007;9:355–64 (Dose 10/160 mg)

<sup>2</sup>Poldermans et al. Clin Ther 2007;29:279–89 (Dose 5–10/160 mg)

# **Effect of ARB/CCB SPC to Asian Patients**

# Asian Data

Efficacy and safety of a single-pill combination of amlodipine/valsartan in Asian hypertensive patients inadequately controlled with amlodipine monotherapy

## Objective

To evaluate the efficacy and safety of a single-pill combination of amlodipine/valsartan compared with amlodipine in Asian hypertensive patients inadequately controlled on amlodipine alone

# Study Populations

## Inclusion Criteria

- Men and Women  $\geq 18$  and  $< 86$  years with mild-to-moderate essential hypertension (mean sitting DBP  $\geq 95$  mmHg and  $< 110$  mmHg)

## Exclusion Criteria

- Severe hypertension (msDBP  $\geq 110$  mmHg and/or msSBP  $\geq 180$  mmHg)
- Secondary hypertension
- A history of hypertensive encephalopathy or cerebrovascular accident; TIA, MI or any type of revascularisation; HF; second or third degree heart block; angina pectoris; significant arrhythmia or valvular heart disease
- Diabetes requiring insulin treatment or poorly controlled type 2 DM
- Known or suspected contraindications or a history of allergy to ARBs or CCBs
- Premenopausal women
- Concomitant use of medications known to have significant effect on BP

# Design

- 8 week, randomised, double-blind, double-dummy, active-controlled, parallel-group study conducted across 20 centres in Asia (12 in China, 5 in Korea, 3 in Singapore)

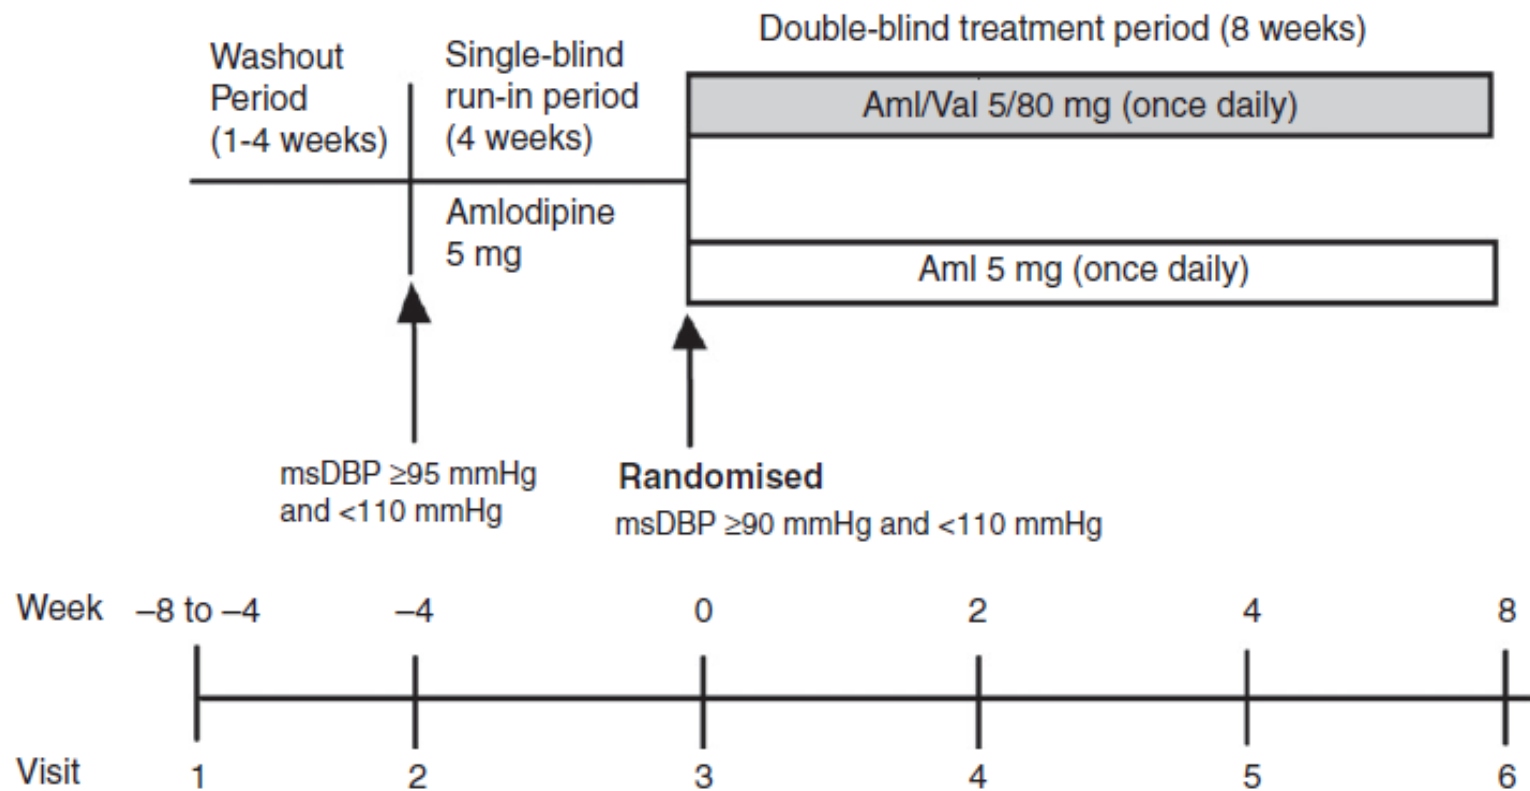

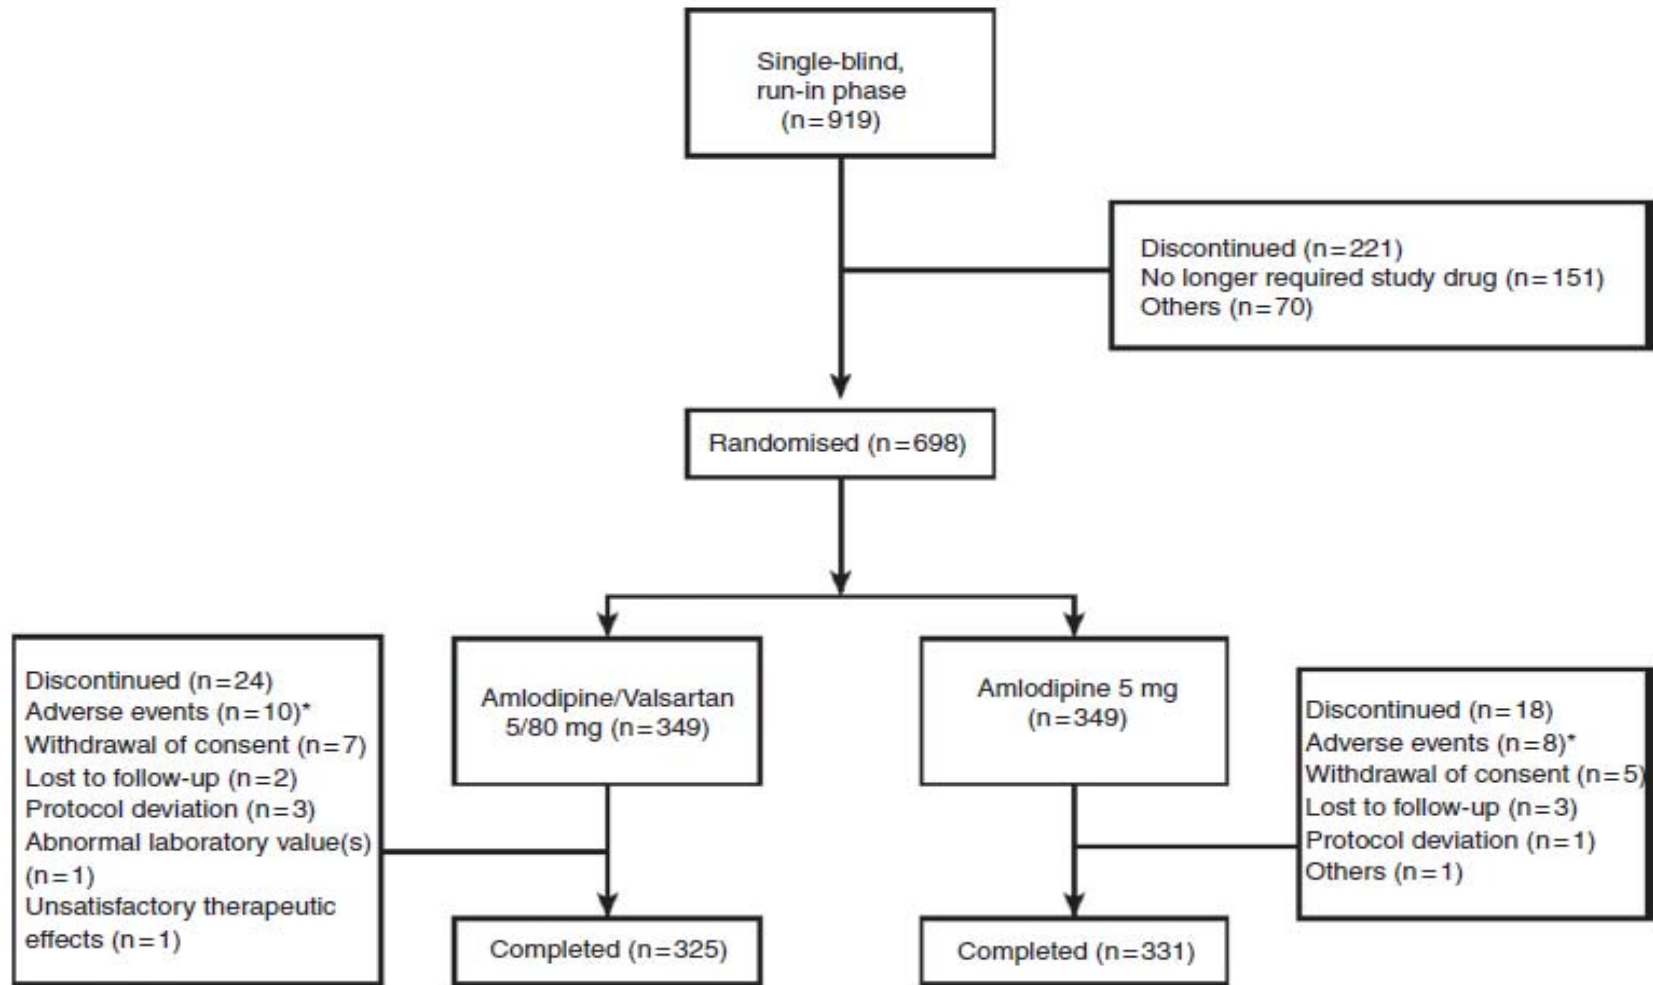

Figure 1. Study design. Aml, amlodipine; Val, valsartan; msDBP, mean sitting diastolic blood pressure.

# Patient Disposition

\* All adverse events (including SAE)

Figure 2. Patient disposition during the treatment period.

# Patient Characteristics

Table 1. Patient baseline and demographic characteristics (full-set analysis population).

Category	Aml/Val, 5/80 mg <i>n</i> = 347*	Aml 5 mg <i>n</i> = 349	<i>p</i> -value
Sex, <i>n</i> (%)			
Male	213 (61.4)	240 (68.8)	0.041 †
Female	134 (38.6)	109 (31.2)	
Age, years	53.4 ± 9.7	54.2 ± 9.1	0.282
Non-elderly (<65 years)	304 (87.6)	305 (87.4)	0.931
Elderly (≥ 65 years)	43 (12.4)	44 (12.6)	
Race/ethnicity			
Chinese	300 (86.5)	301 (86.2)	0.936
Other	47 (13.5)	48 (13.8)	
BMI, kg/m <sup>2</sup> , <i>n</i>	25.8 ± 3.1, 344	25.7 ± 3.0, 347	0.580
Type 2 diabetes history, <i>n</i> (%)	24 (6.9)	31 (8.9)	0.336
Duration of hypertension (years)	8.3 ± 7.45	8.4 ± 7.88	0.842
Mean sitting DBP (mmHg)	94.5 ± 4.24	94.5 ± 4.28	0.912
Mean sitting SBP (mmHg)	139.8 ± 11.90	139.3 ± 11.38	0.610

\*Two patients in the Aml/Val group were excluded from the full-set analysis population for having no post-baseline efficacy assessment.

†Indicates statistical significance at 0.05 level.

Aml, amlodipine; Val, valsartan; BMI, body mass index; DBP, diastolic blood pressure; SBP, systolic blood pressure.

# Efficacy Outcomes

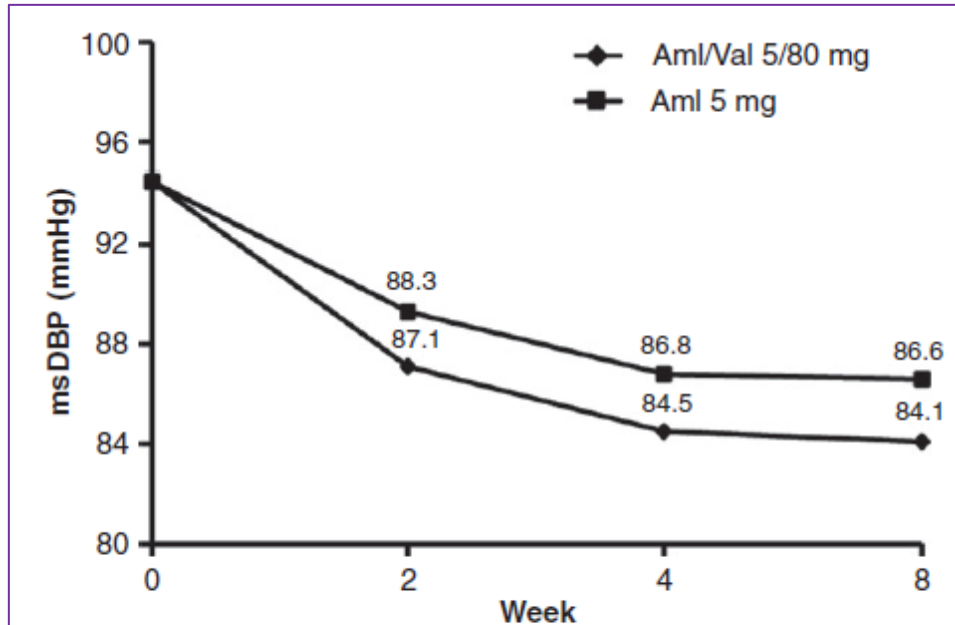

Figure 3. Mean sitting diastolic blood pressure (msDBP) by treatment and week (Full-set analysis population).  $p < 0.0001$  for both the treatment groups at week 4 and at week 8. Aml, amlodipine; Val, valsartan; msDBP, mean sitting diastolic blood pressure.

Figure 4. Mean sitting systolic blood pressure (msSBP) by treatment and week (full-set analysis population).  $p < 0.0001$  for both the treatment groups at week 4 and at week 8. Aml, amlodipine; Val, valsartan; msSBP, mean sitting systolic blood pressure.

- The Benefit of combination therapy was observed as early as week 2 and sustained until week 8
- Response Rates : 79.3% vs. 66.8% ( $p < 0.0001$ )
- BP Control Rates : 69.2% vs. 57.6% ( $p = 0.0013$ )

# Ambulatory BP measurement

Table 3. Change from baseline in mean 24-hour, daytime and nighttime ambulatory BP (mmHg).

	Aml/Val 5/80 mg ( <i>n</i> = 41)		Aml 5 mg ( <i>n</i> = 41)	
	Baseline	Change	Baseline	Change
Mean ambulatory DBP, mean (SD)				
24-hour	88.4 (7.86)	-6.3 (5.85)*	84.5 (7.33)	0.3 (5.82)
Daytime	92.7 (8.40)	-7.2 (6.12)†	88.7 (8.40)	-0.4 (6.81)
Nighttime	79.8 (8.60)‡	-4.8 (7.83)†‡	76.2 (7.31)	1.2 (6.78)
Mean ambulatory SBP, mean (SD)				
24-hour	132.2 (10.28)	-7.3 (7.62)*	130.8 (9.68)	-0.2 (8.64)
Daytime	136.9 (11.16)	-8.3 (8.04)†	135.7 (10.61)	-1.1 (9.53)
Nighttime	122.4 (10.70)‡	-5.4 (9.33)†‡	121.4 (10.12)	0.9 (10.02)

\**p* < 0.0001 vs. Aml 5 mg; †*p* < 0.005 vs. Aml 5 mg; ‡*n* = 40.

Aml, amlodipine; Val, valsartan; DBP, diastolic blood pressure; SBP, systolic blood pressure; SD, standard deviation.

- At week 8 endpoint, the reductions in 24-h ambulatory BP from baseline were significant in the Aml/Val group (7.3/6.3mmHg;*p*<0.0001), whereas the change was not significant with Aml 5mg alone (-0.2/+0.3mmHg; *p*>0.05)

# Ambulatory BP measurement

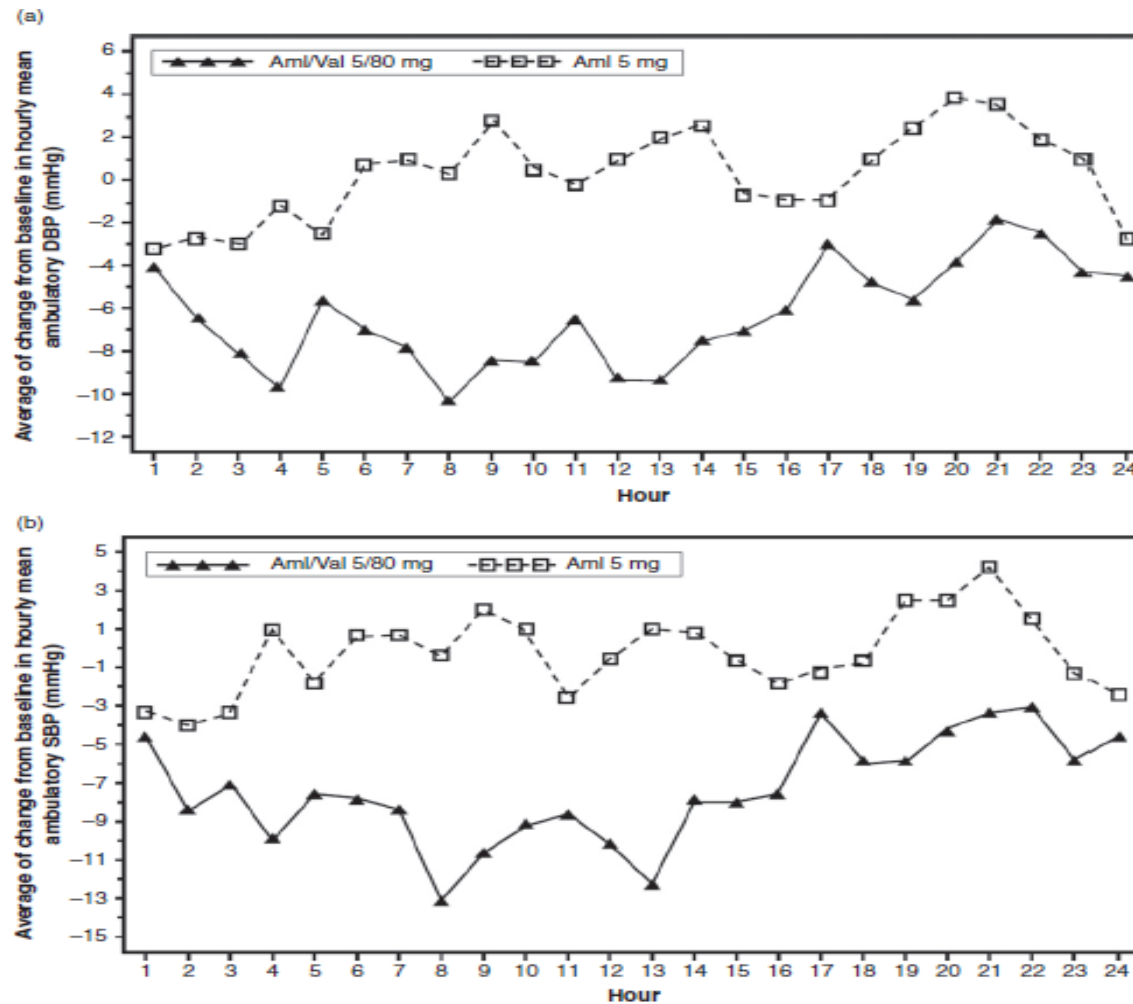

Figure 5. Change from baseline in hourly mean ambulatory BP (full-set analysis population). (a) Mean ambulatory DBP by post-dosing hour and treatment group (b) Mean ambulatory SBP by post-dosing hour and treatment group. Aml, amlodipine; Val, valsartan; DBP, diastolic blood pressure; SBP, systolic blood pressure.

# Safety

Table 4. Overall incidence of adverse events during the double-blind treatment period.

	Aml/Val 5/80 mg <i>n</i> = 349 <i>n</i> (%)	Aml 5 mg <i>n</i> = 349 <i>n</i> (%)
Any adverse event	88 (25.2)	86 (24.6)
Deaths	0 (0.0)	0 (0.0)
SAEs	4 (1.1)	2 (0.6)
AEs leading to discontinuation	10 (2.9)	7 (2.0)
Drug-related AE discontinuations	7 (2.0)	5 (1.4)
SAE discontinuation	0 (0.0)	1 (0.3)
AEs $\geq$ 2%		
Hyperlipidaemia	15 (4.3)	11 (3.2)
Dizziness	10 (2.9)	7 (2.0)
Abnormal hepatic function	8 (2.3)	5 (1.4)

Aml, amlodipine; Val, valsartan; AE, adverse event; SAE, serious adverse event.

## Summary

- Once-daily treatment with the single-pill combination of Aml/Val resulted in clinically and statistically significant additional BP reductions and greater BP control than Aml in Asian hypertensive patients inadequately controlled on Aml monotherapy
- Consistent with the previous findings in non-Asian cohorts, the combination was well-tolerated.

# Conclusion

A good proportion of patients require 2 or more antihypertensive medications to reach BP goal<sup>1-3</sup>, especially in the era of global cardiovascular risk management.

When combination therapy is required,  
the use of Fixed dose combinations to improve adherence<sup>4</sup>

When combination therapy is required, most guidelines recommend (when there are no compelling indications)  
For dual: a combination of a RAAS blocker and a diuretic, or a RAAS blocker and a calcium channel blocker<sup>4</sup>
