Non-Progressive and Progressive Coronary Plaques

non-progressive → progressive

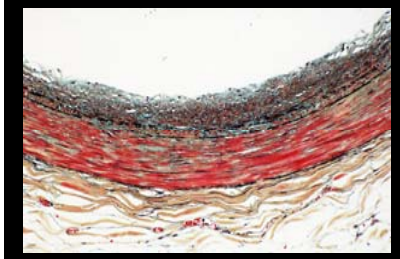
adaptive intimal thickening

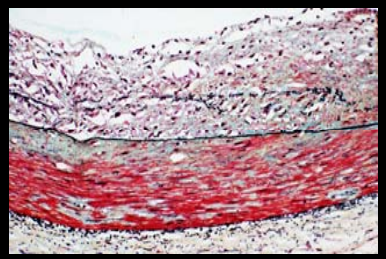
Intimal xanthoma

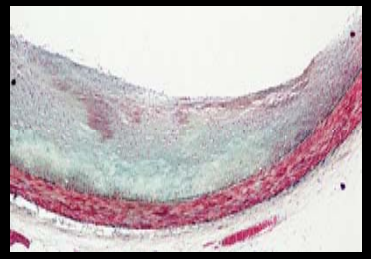
pathologic intimal thickening

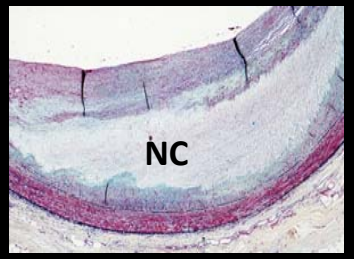
fibroatheroma

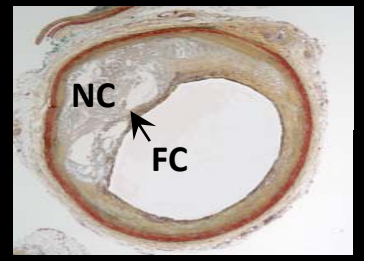
thin-cap fibroatheroma

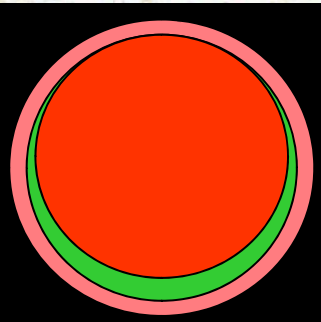


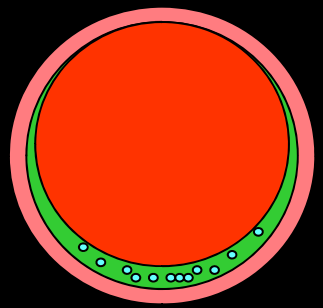


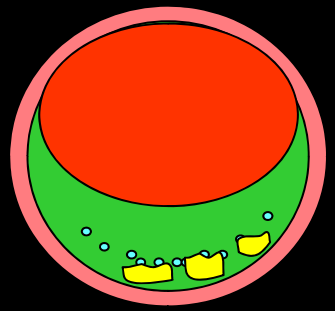


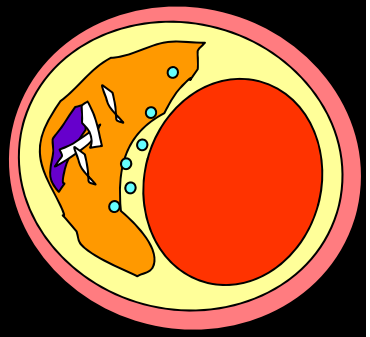












lipid pool

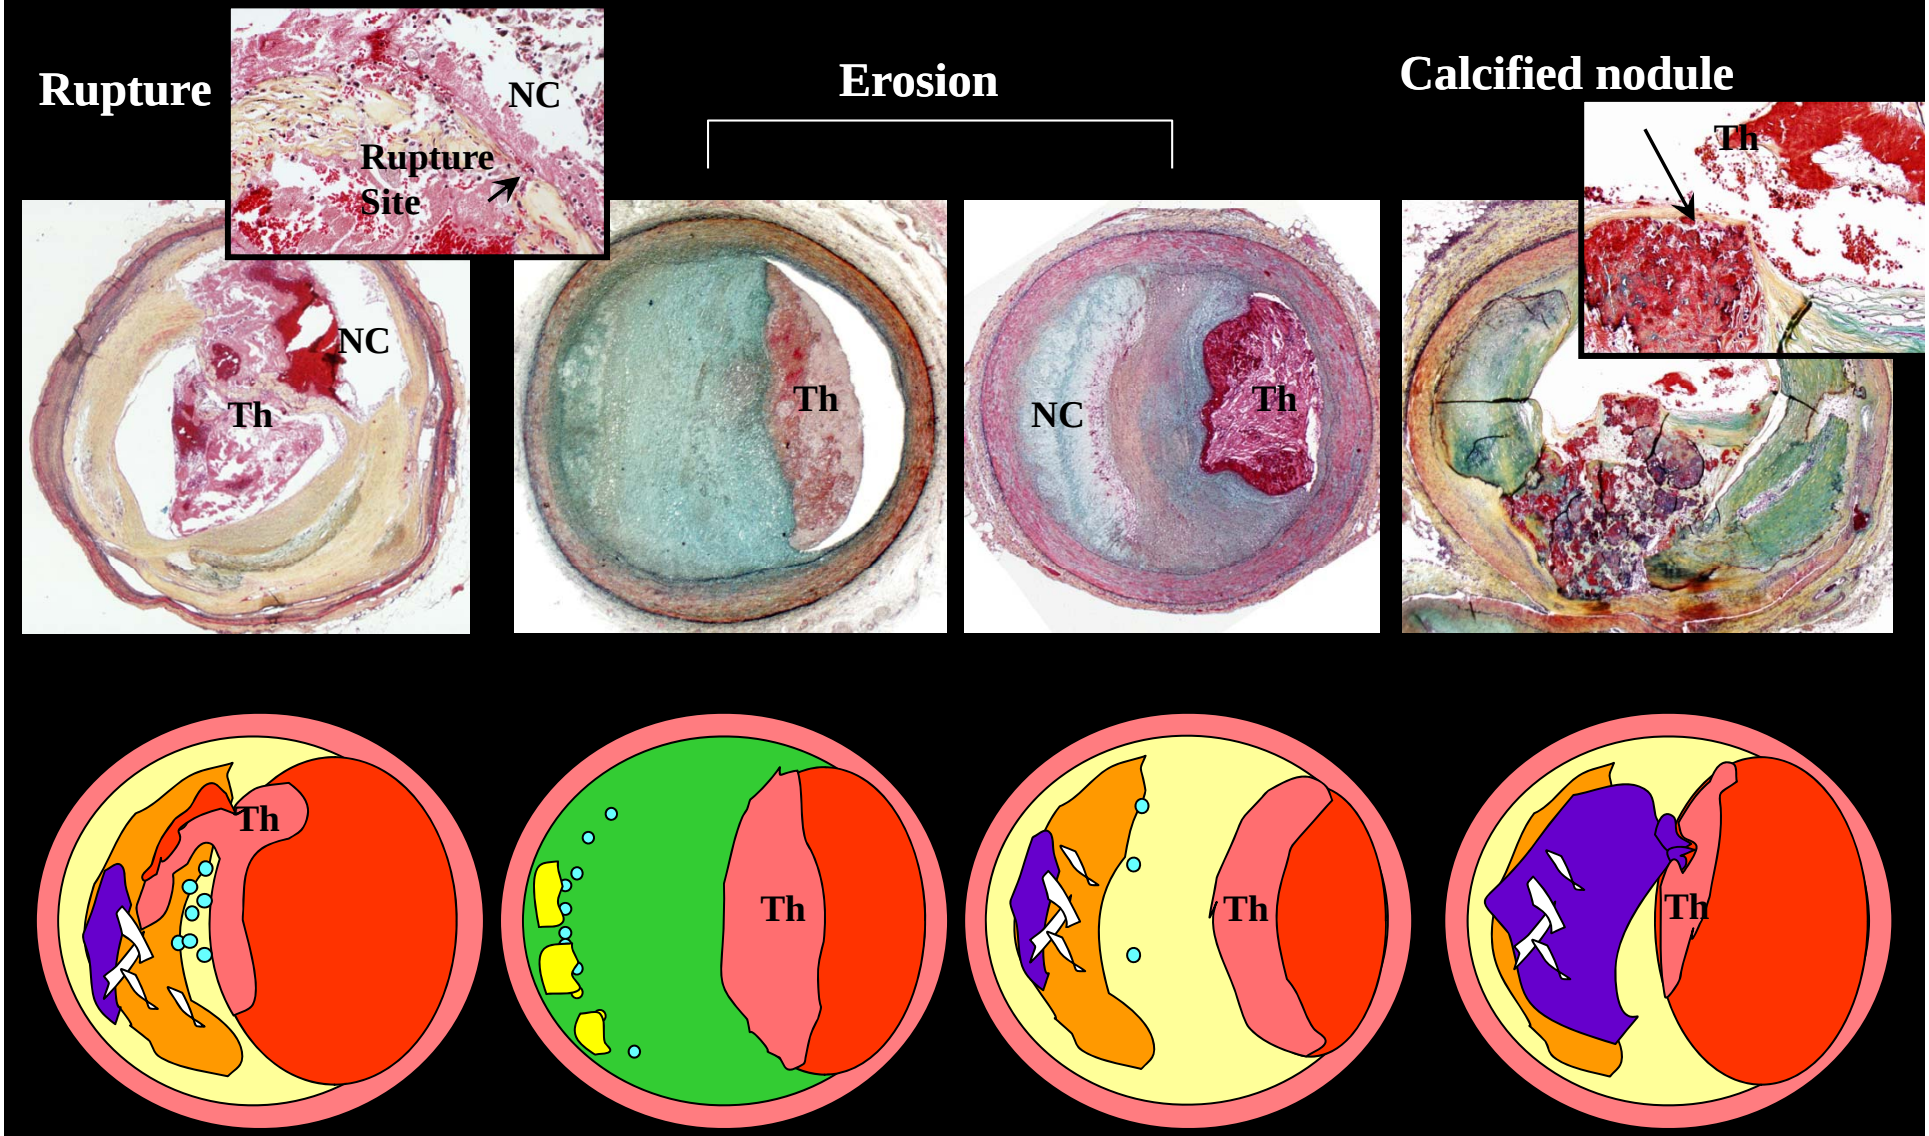
necrotic core

early → late necrosis

Lesions with Thrombi

- *Plaque Rupture*
- *Plaque Erosion*
- *Calcified Nodule*

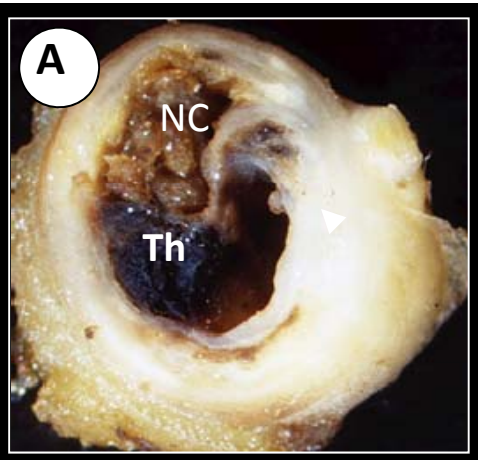
Causes of Coronary Thrombosis

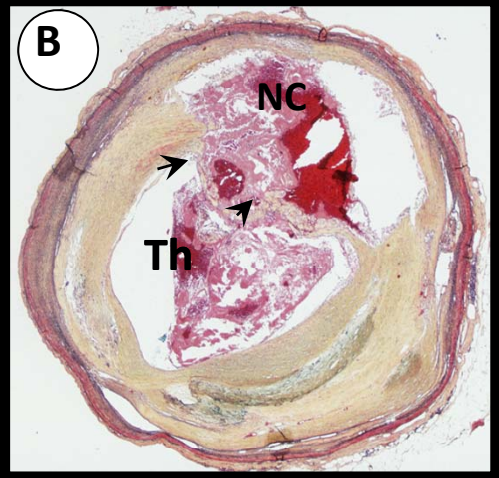


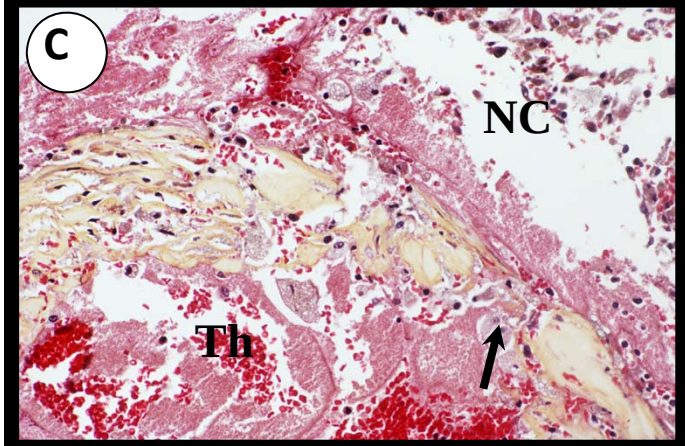
Virmani R, et al. Arterioscler Thromb Vasc Biol 2000;20:1262

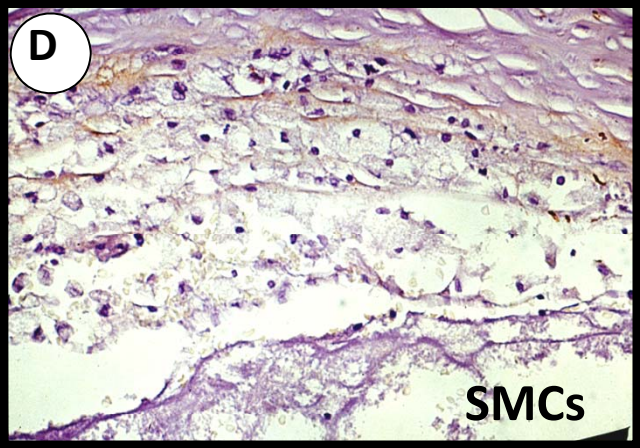
Gross and Light Microscopic Features of Plaque Rupture

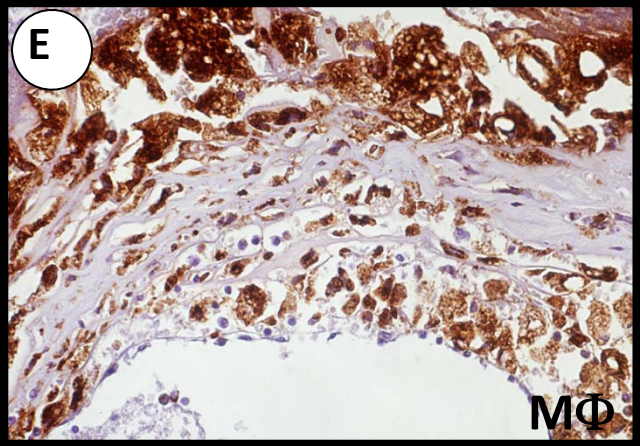
60-65% of Thrombi in Sudden Coronary Death occur form Plaque Rupture

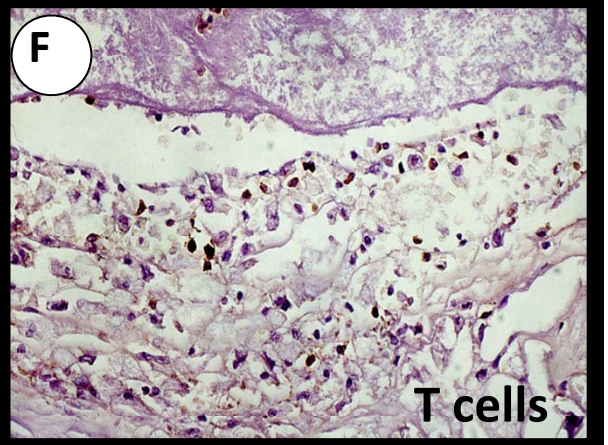


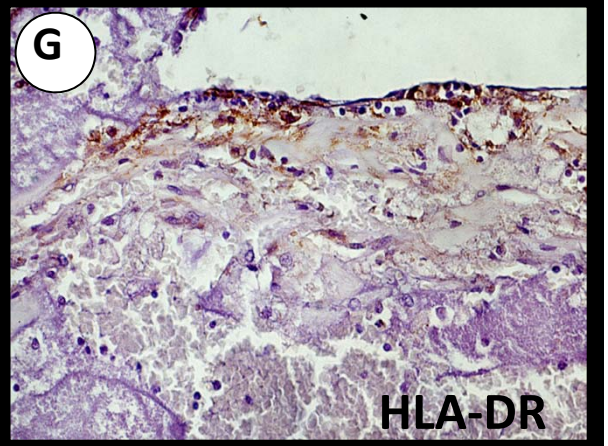






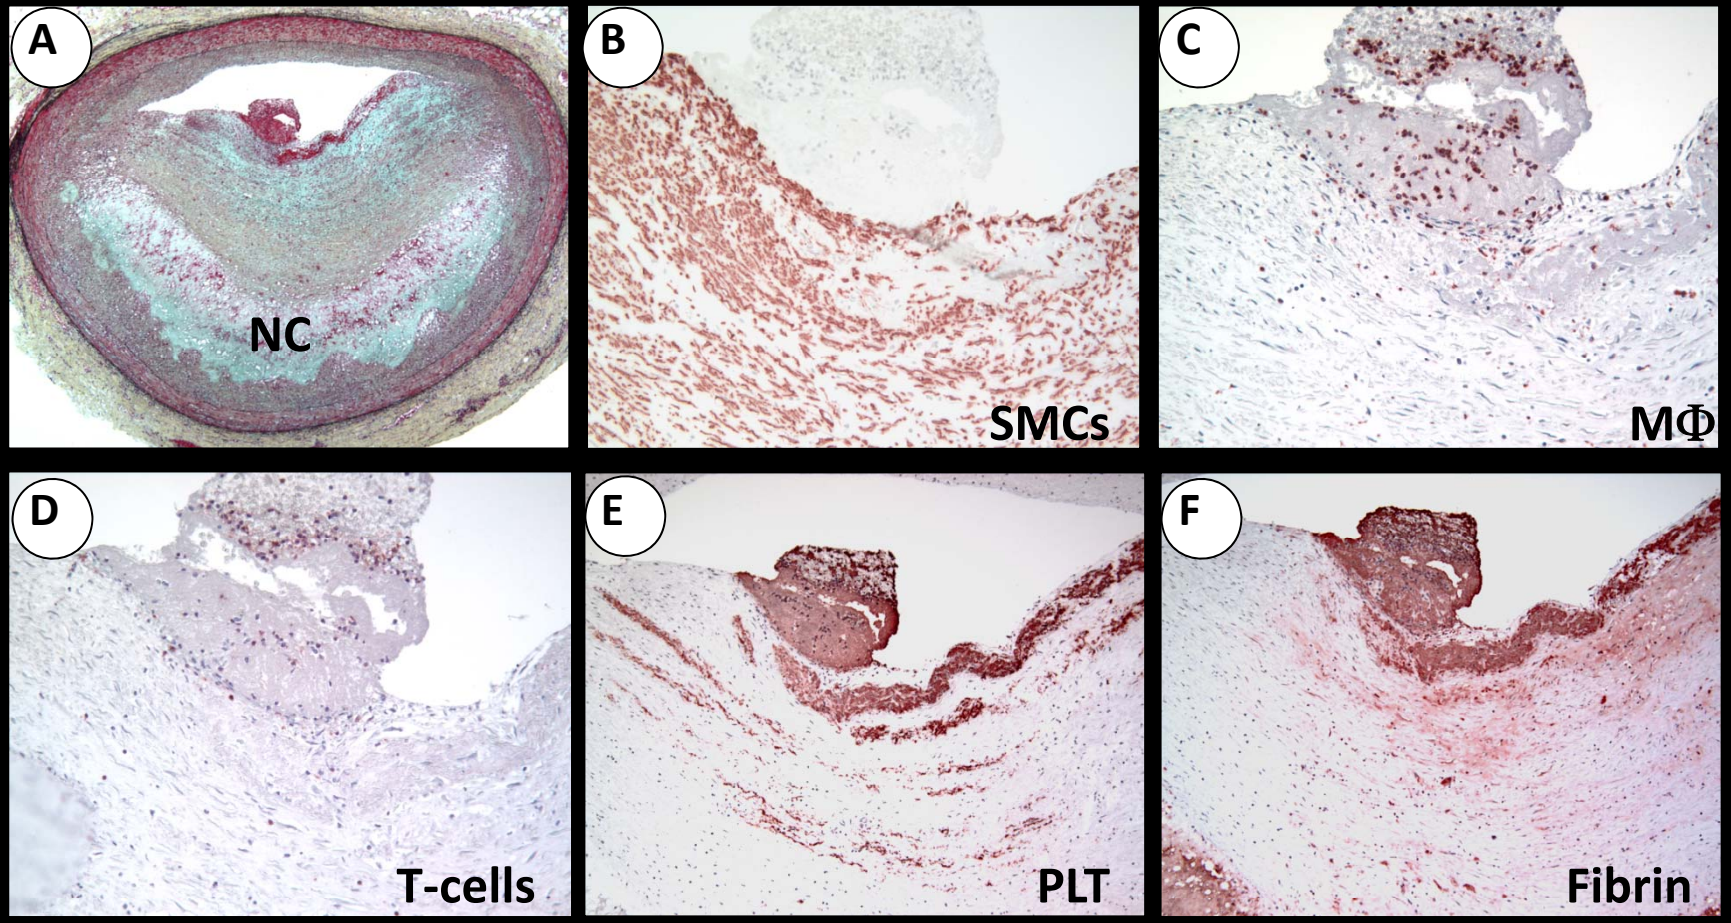




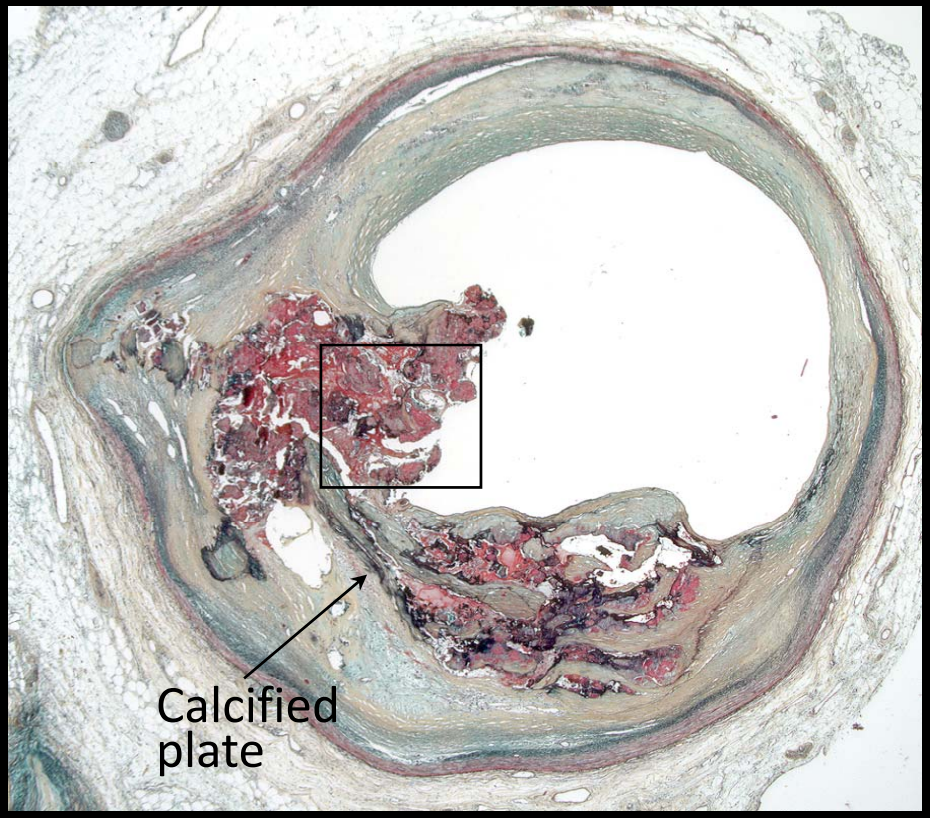


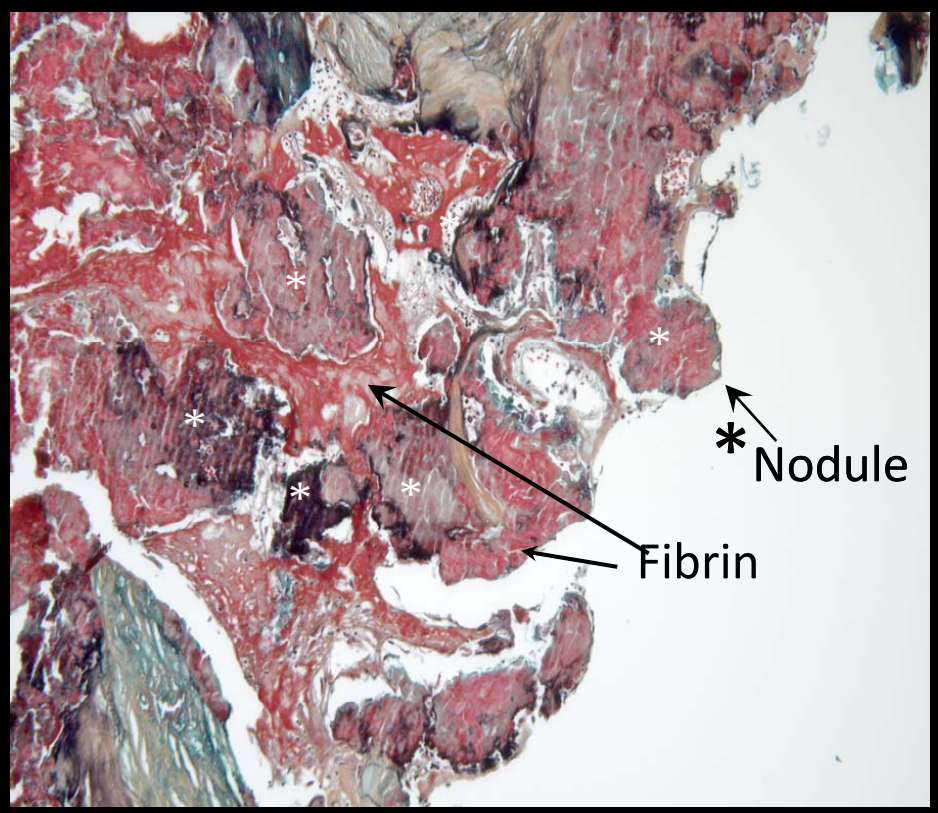
Plaque Erosion: 30-35% of thrombi in SCD

Plaque erosion in a 33 year-old female complaining of chest pain for two-weeks and discharged from the emergency room with a diagnoses of anxiety.



Calcified Nodule

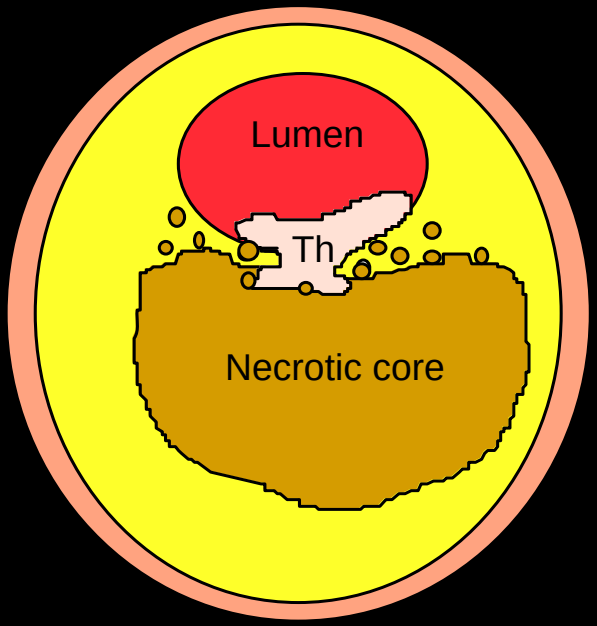




Frequency 2-7% of SCD, Older individuals, usually Men, T2D and Prediabetes, equally common in tortuous right and left coronary arteries

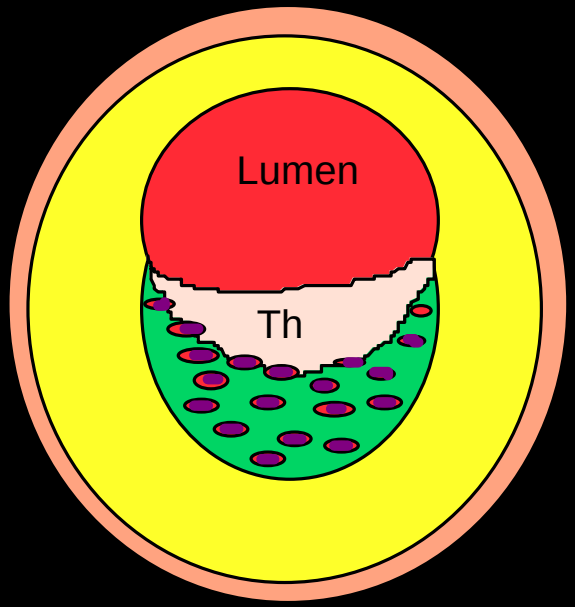
Clinical and Morphologic Difference in Plaques Associated with Luminal Thrombi

Plaque rupture



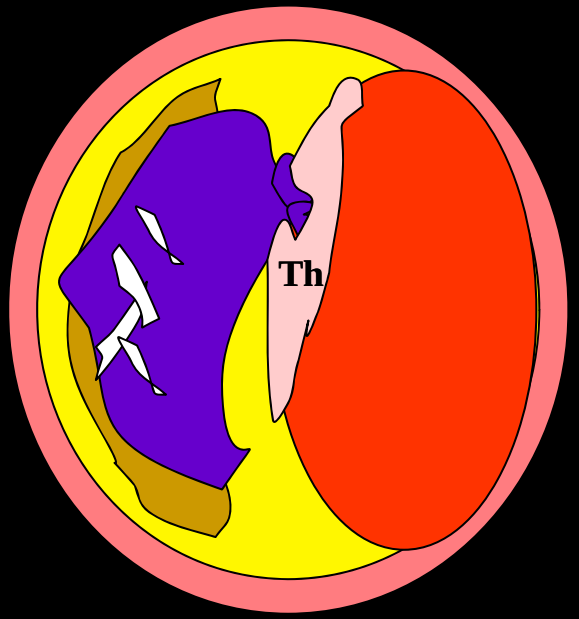
60% thrombi in SCD
M>F, Older, Ca^{++}
Eccentric = concentric
Greater % stenosis
Macs, T cells,
HLA-DR

Plaque erosion



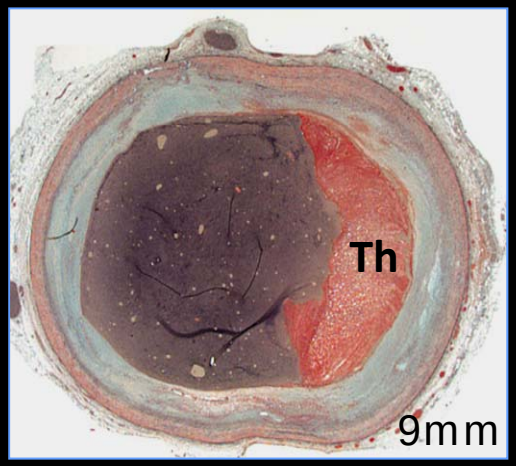
30-35% thrombi in SCD
M=F, younger
Usually eccentric
Lesser % stenosis
SMC rich, proteoglycans

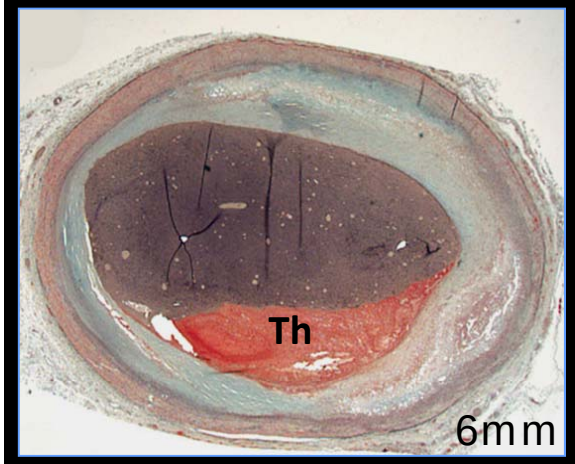
Calcified nodule

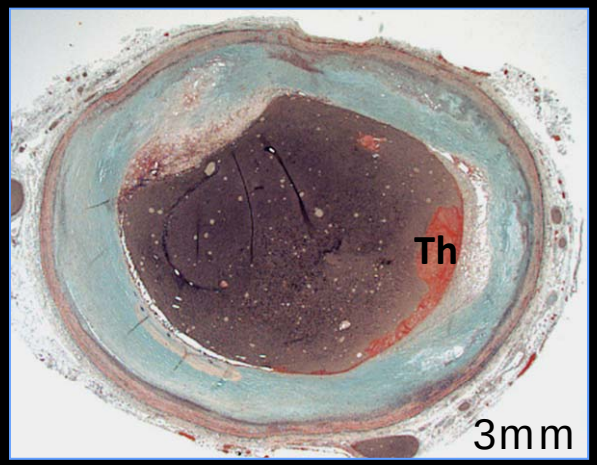


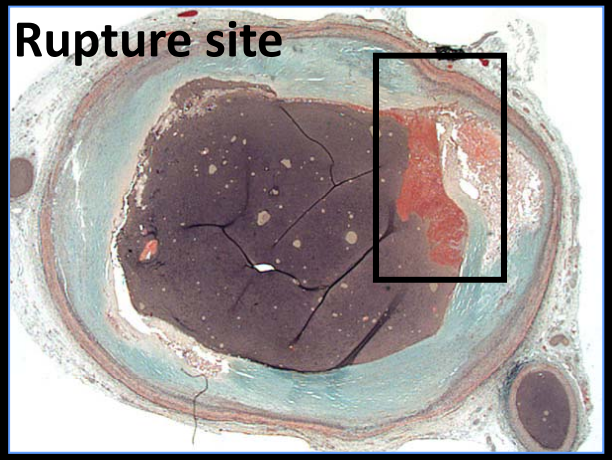
2-7% thrombi in SCD, calcified plates
M>F, older, mid RCA, LAD
Usually eccentric
Stenosis variable
Nodules of bone

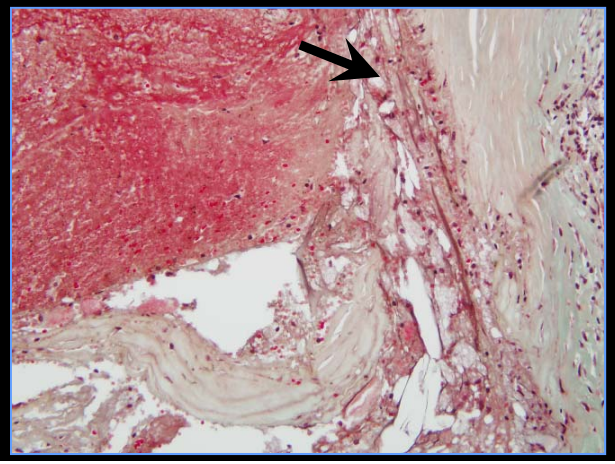
Plaque rupture with mild stenosis and non-occlusive thrombus: a mechanism by which plaques progress from an asymptomatic to symptomatic phase

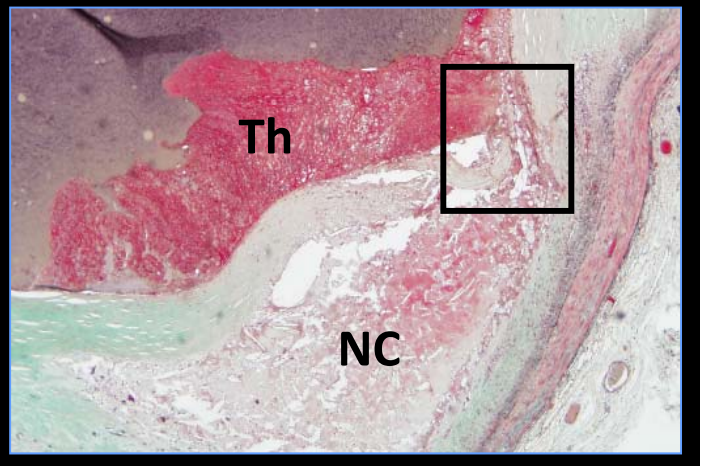






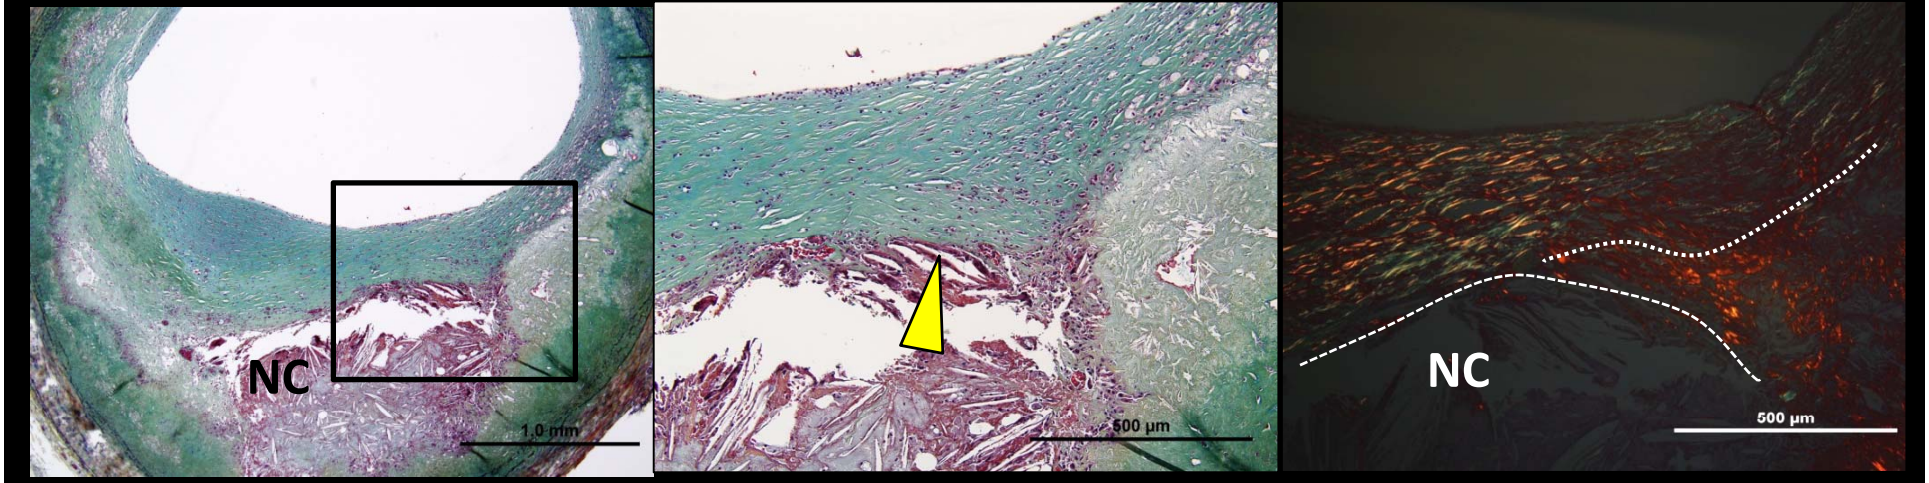




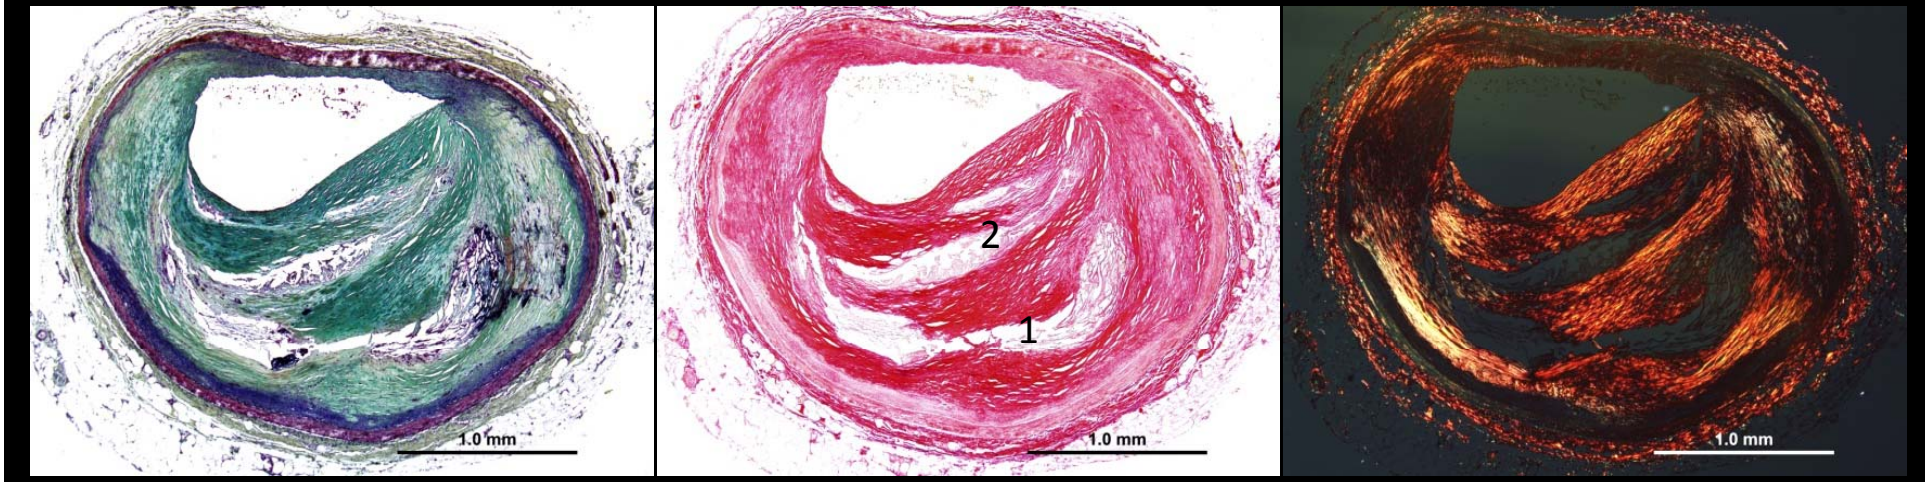


Healed lesions lead to plaque progression

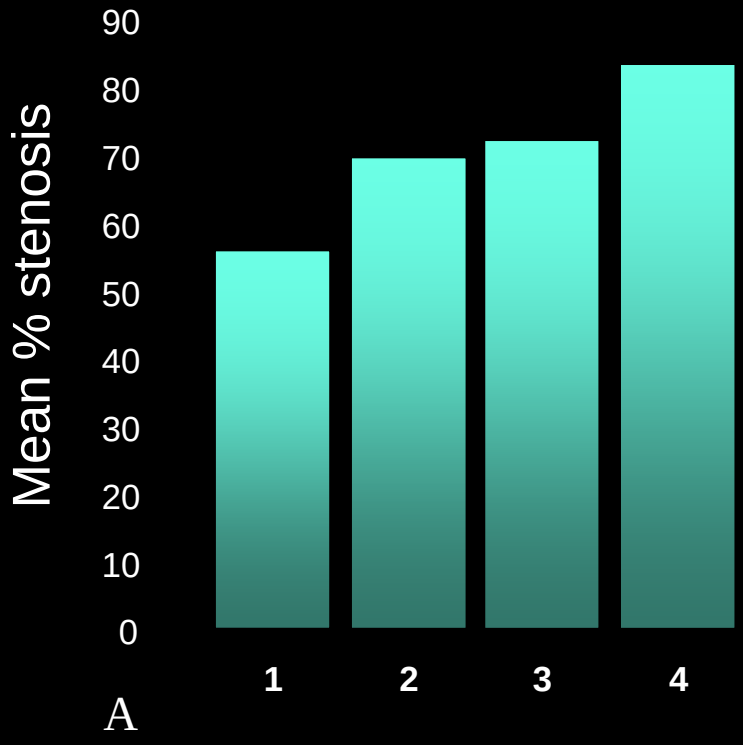
Healed plaque rupture

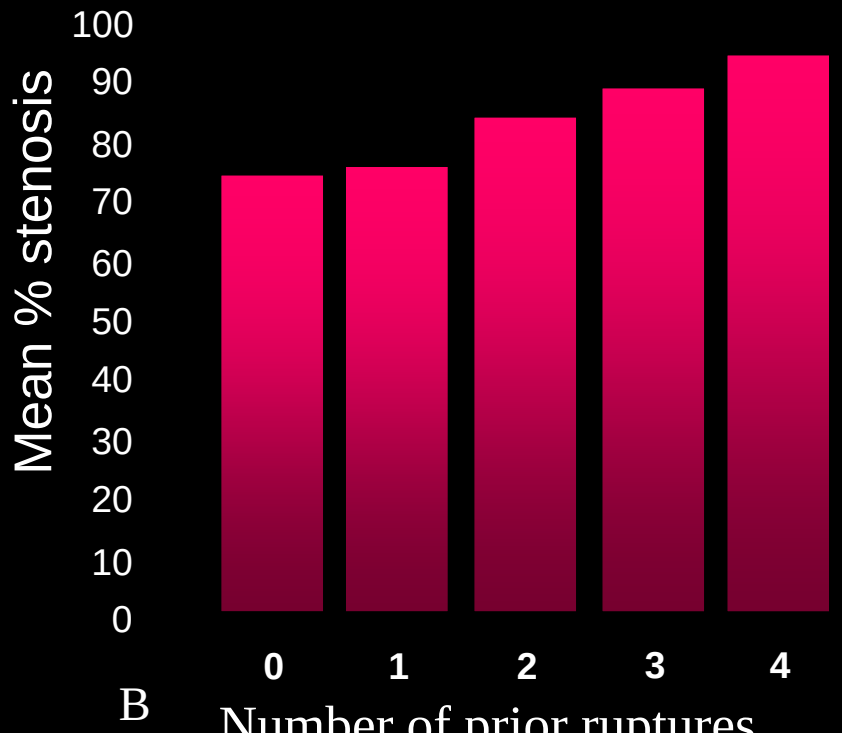


Multiple healed rupture



Mean % stenosis increases with number of prior rupture sites





Burke, A P et al. Circulation 2001;103:9364-940

Progression of Human Coronary Atherosclerosis

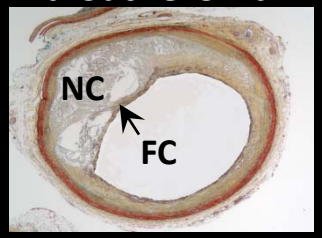
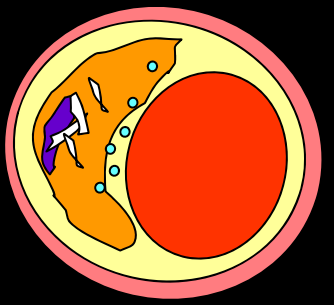
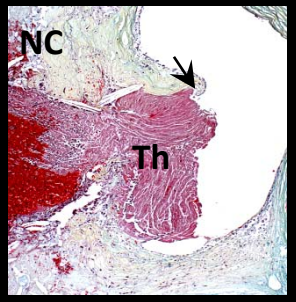
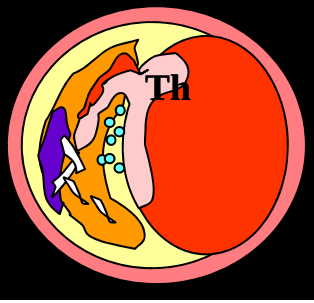
Thin-cap Fibroatheroma



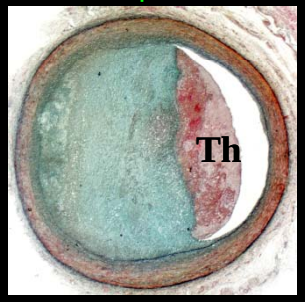


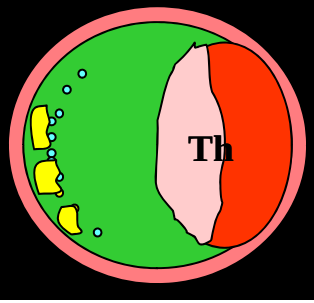
Rupture

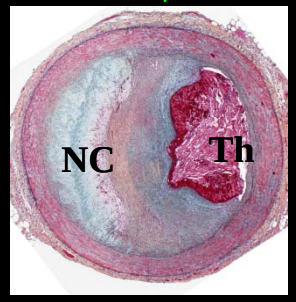


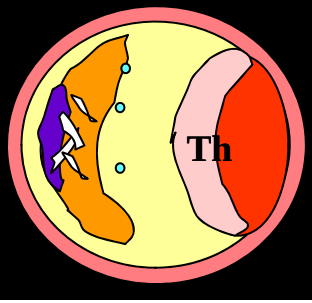


Erosion

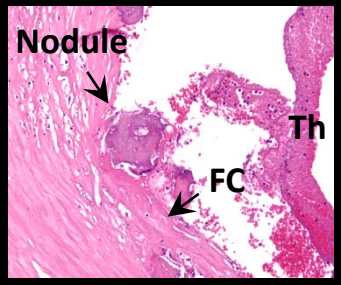


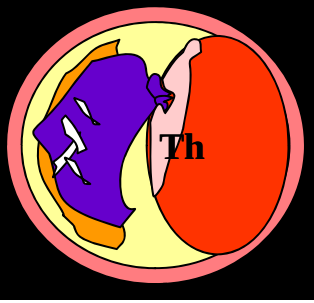




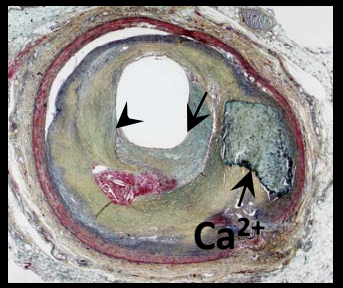


Calcified nodule



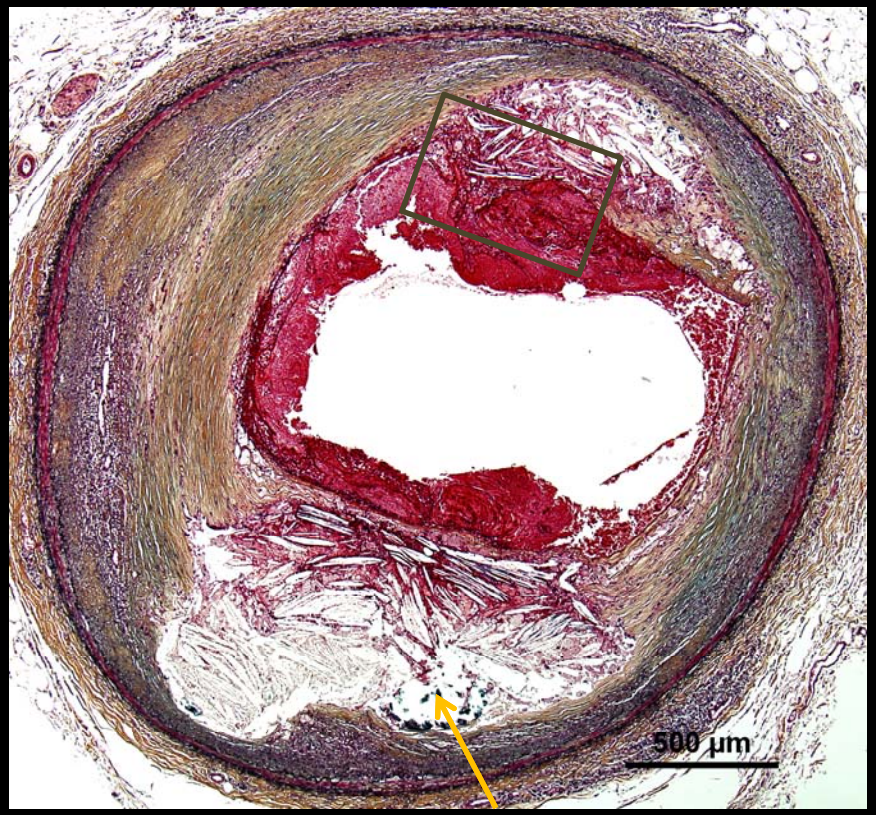


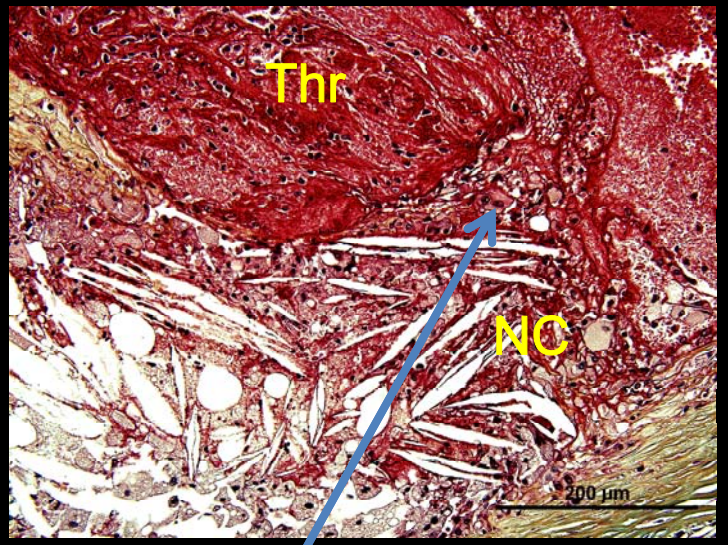
Healed Rupture



Development of Necrotic Core

The Necrotic Core
"graveyard of dead Mϕs"



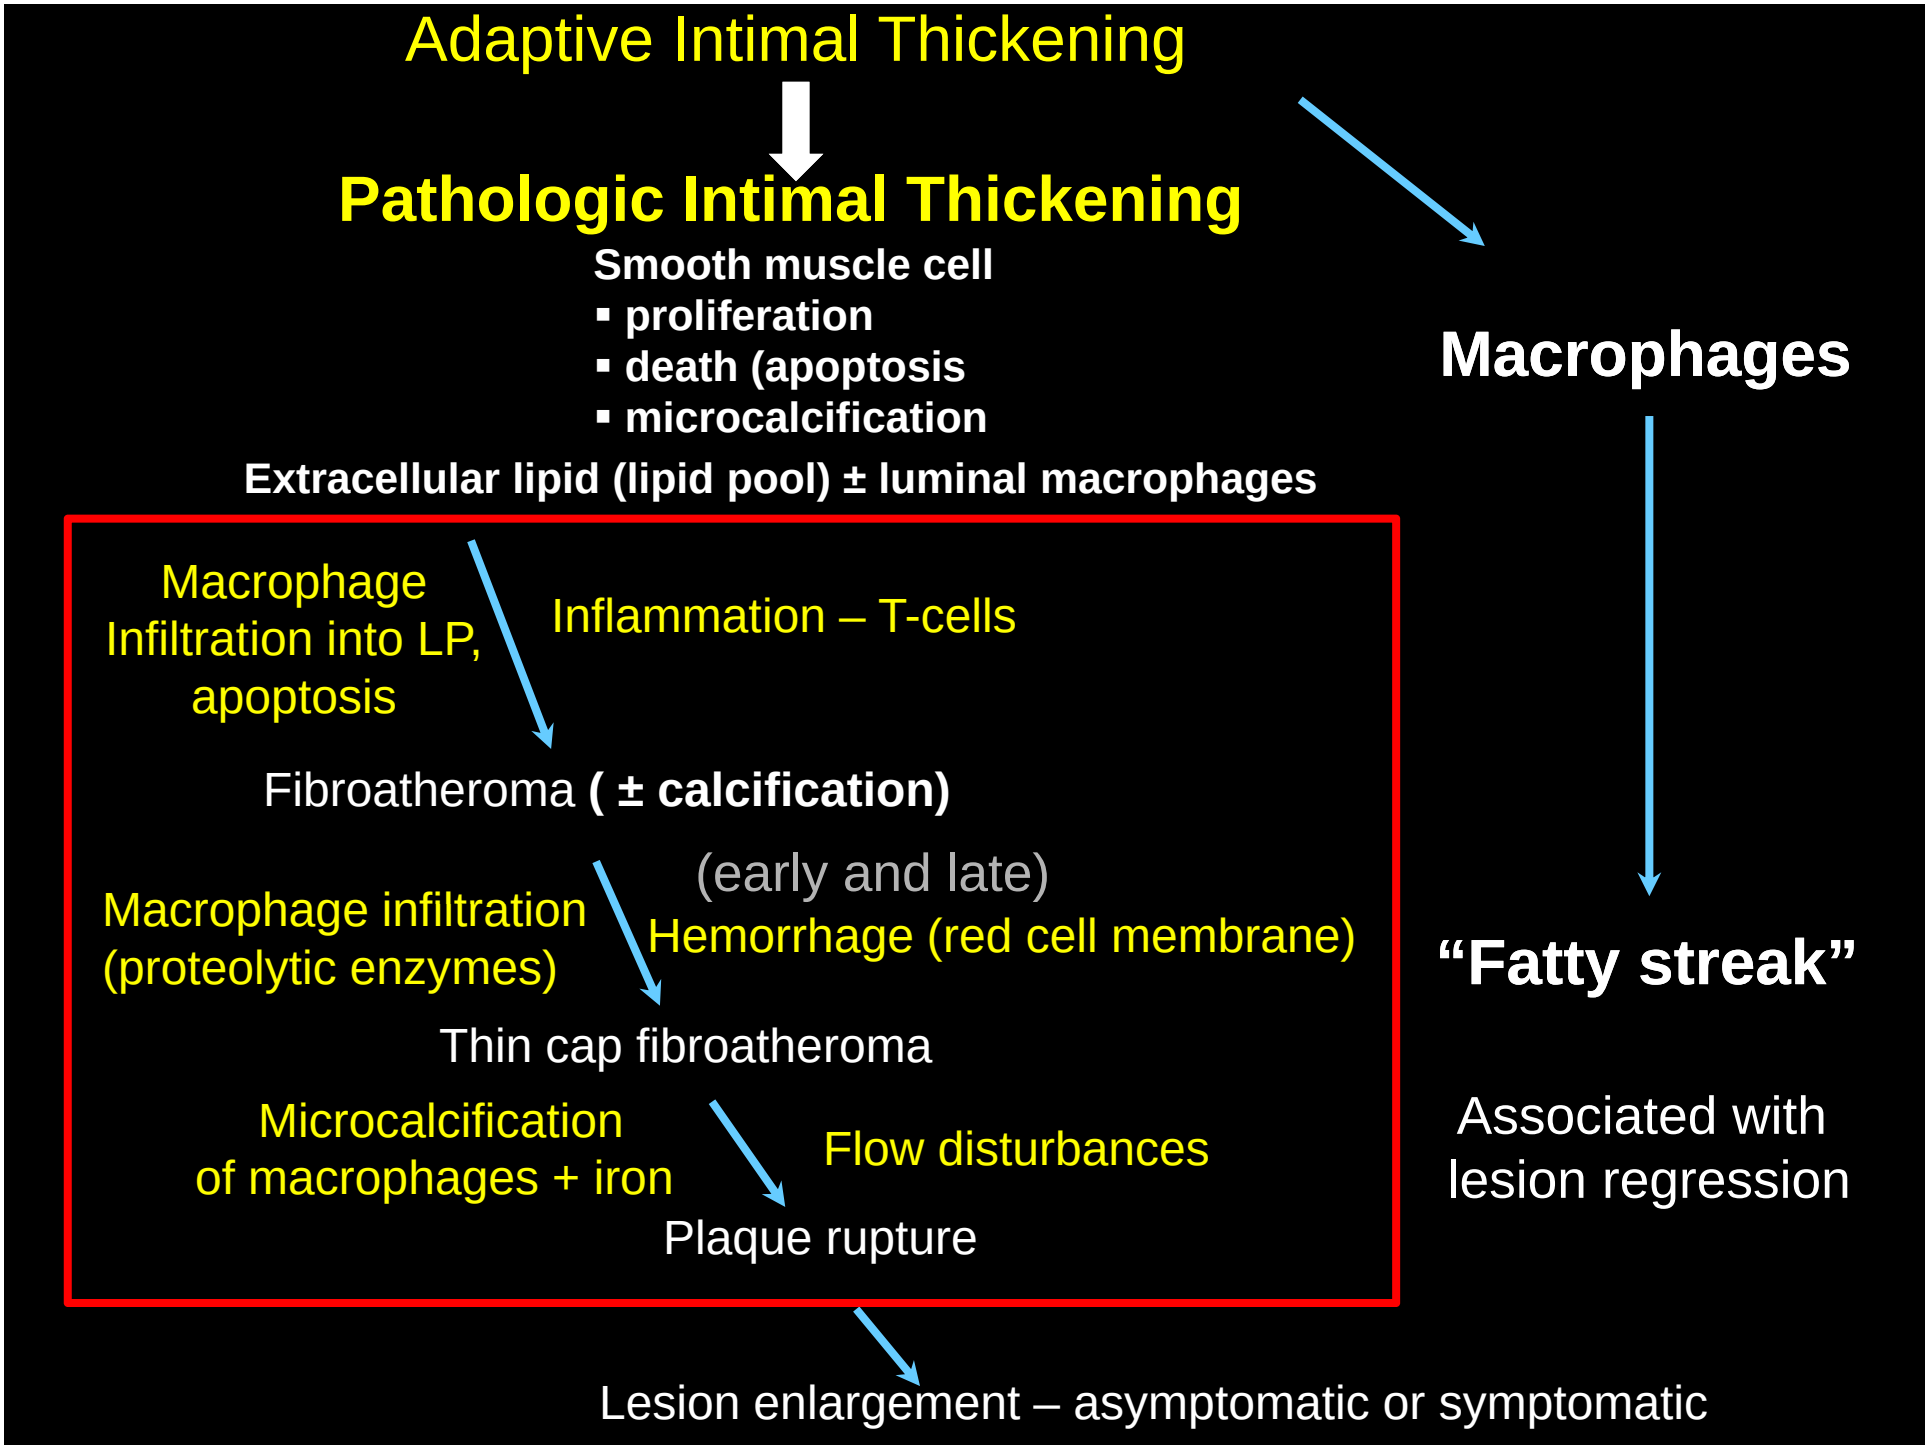


Ruptured plaque at area of thinned fibrous cap

Necrotic Core

- inflammation
- Coagulation thrombosis
- proteases
- stress on fibrous cop

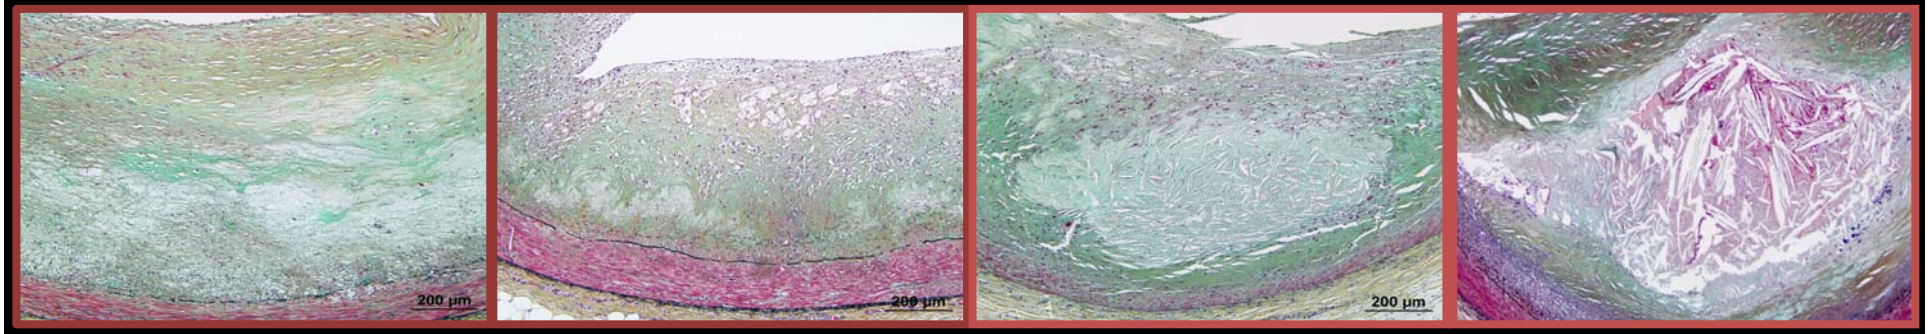
Thorpe and Tabas J Leukoc Biol 2009;86:1089-95



Adaptive Intimal Thickening
Pathologic Intimal Thickening
Smooth muscle cell
▪ proliferation
▪ death (apoptosis
▪ microcalcification
Extracellular lipid (lipid pool) ± luminal macrophages
Macrophages
Macrophage Infiltration into LP, apoptosis
Inflammation – T-cells
Fibroatheroma (± calcification)
(early and late)
Macrophage infiltration (proteolytic enzymes)
Hemorrhage (red cell membrane)
Thin cap fibroatheroma
Microcalcification of macrophages + iron
Flow disturbances
Plaque rupture
"Fatty streak"
Associated with lesion regression
Lesion enlargement – asymptomatic or symptomatic

Histomorphometric Analysis of Progressive Coronary Lesions

Pit (no Macs) Pit (+ Macs) Early FA Late FA



Lesion Type (n=61)	Plaque Area (mm2)	Stenosis (%)	NC Area (mm)	Macrophages (%)	Apoptotic cells/mm	No Vasa Vasorum
PIT - M (n=12)	3.3 ± 1.9	42 ± 10		0.7 ± 0.7	1.8 ± 1.3	
PIT + M (n=16)	2.5 ± 1.1	46 ± 14		1.8 ± 1.5	2.4 ± 1.6	4.6 ± 7.6
Early Fibroatheroma (n=19)	4.8 ± 2.5	60 ± 12	0.93 ± 0.92	3.1 ± 3.8	3.1 ± 2.1	10.1 ± 5.6
Late Fibroatheroma (n=14)	5.8 ± 2.7	70 ± 13	1.34 ± 0.70	4.3 ± 3.7	5.4 ± 3.3	31.1 ± 35.4
P value	<0.0001	<0.0001	0.16	<0.0001	0.004	0.02

Differential Expression of Hyaluronan and Versican in the Developing Necrotic Core

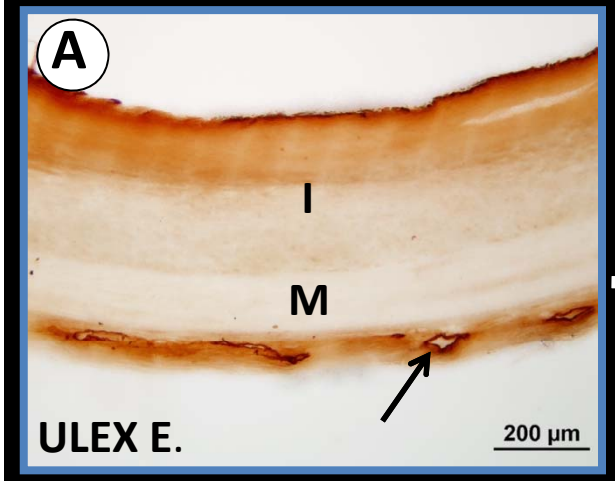
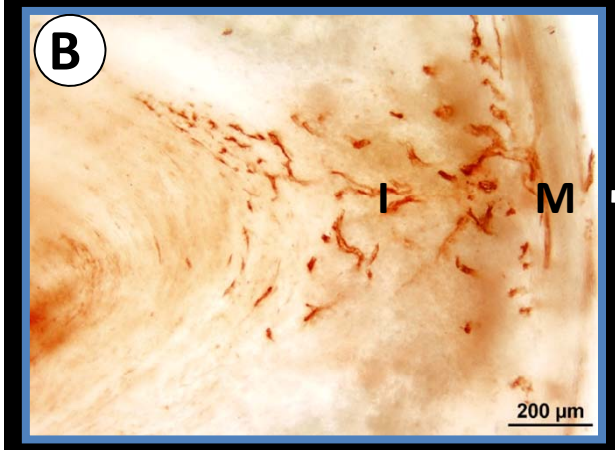
Intraplaque Hemorrhage, Oxidant Stress & Plaque Vulnerability

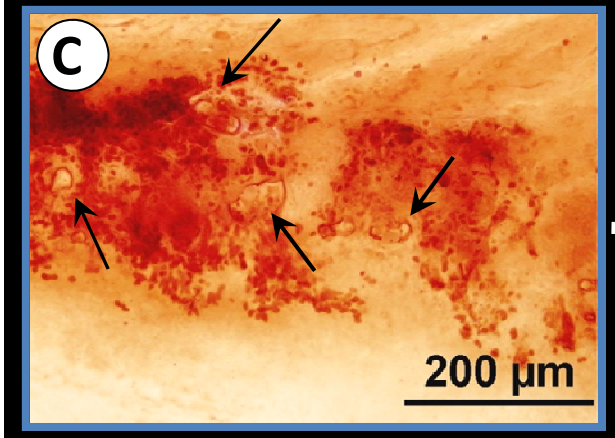
Evidence that Human Coronary Plaques Express a Latent Proangiogenic Phenotype



Normal artery with adventitial Vv

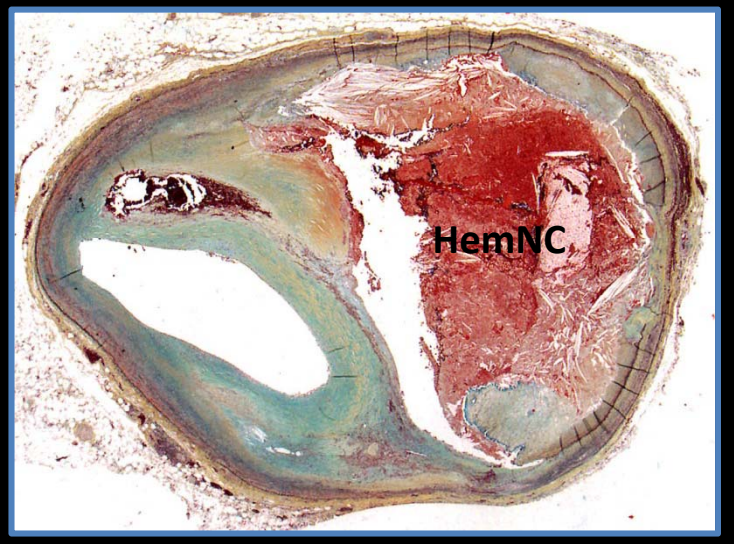


Fibroatheroma with Tortuous and Abnormal Vv



Fibroatheroma with Leaky Vv (peri-vascular hemorrhage)

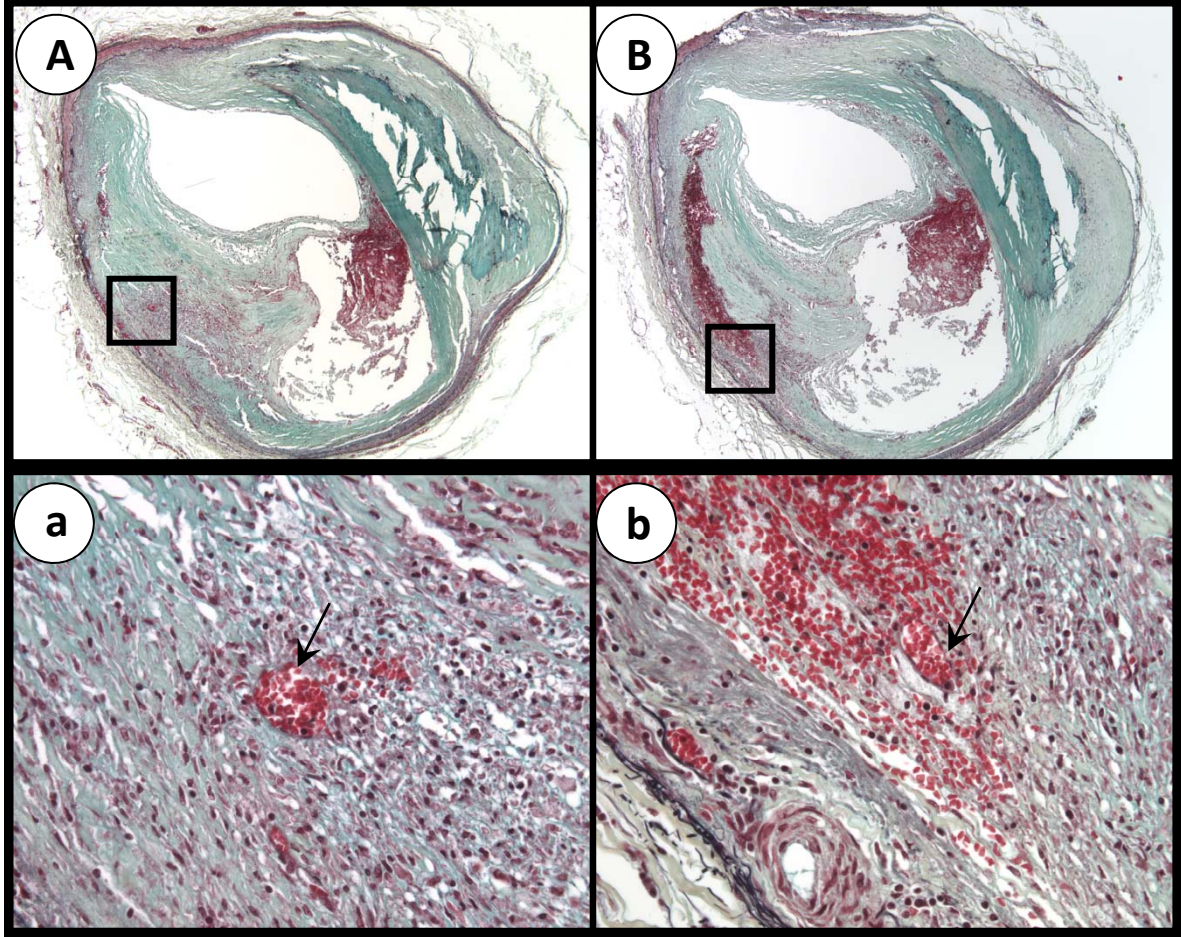
Fibroatheroma with severe Intraplaque hemorrhage

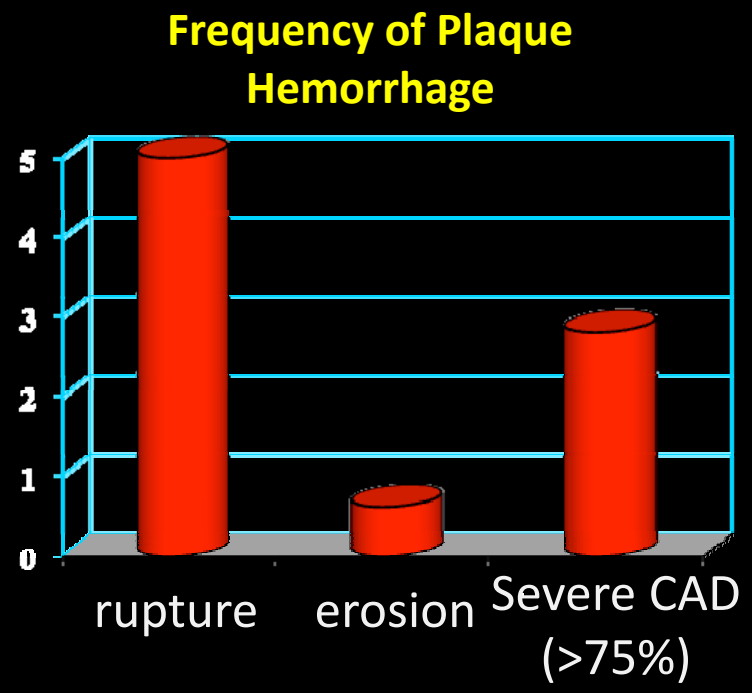


Modified from Jain et al., Nat Clin Pract Cardiovasc Med, 2007)

Thin-cap Fibroatheroma

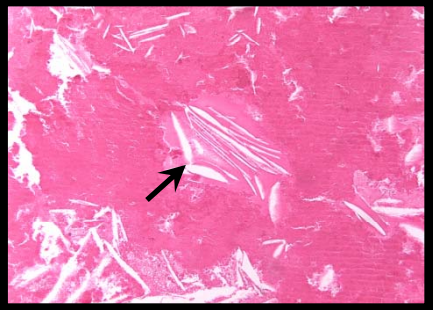
Recent Intraplaque Hemorrhage is seen at Multiple sites in Patients Dying SCD

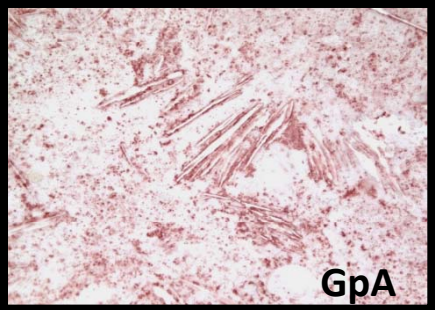


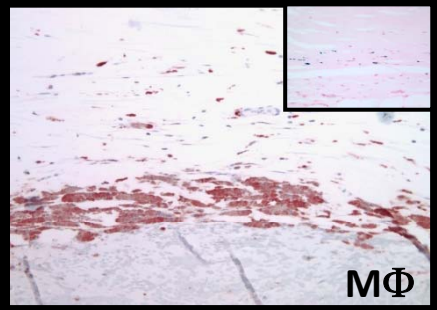


Morphometric Analysis of Hemorrhagic Events in Human

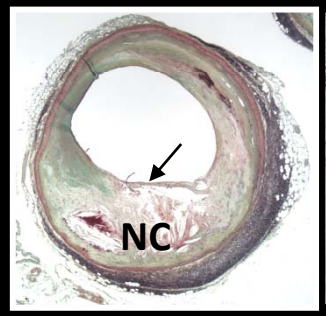
Hemorrhagic Pericarditis

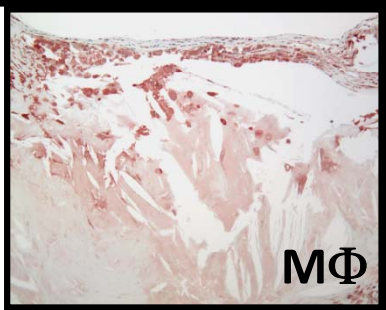


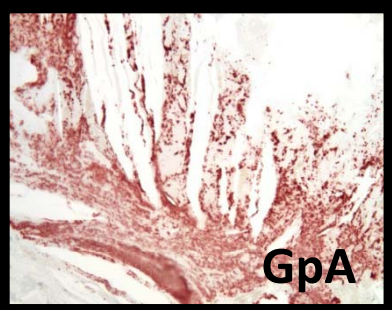




Vulnerable Plaque







Plaque Type	GpA Score	Iron	Necrotic Core (mm^2)	MΦ (mm^2)
PIT ***no*** **core** *(n=129)*	0.09±0.04	0.07±0.05	0.0	0.002±0.001
FA *early* core *(n=79)*	0.23±0.07	0.17±0.08	0.06±0.02	0.018±0.004
FA *late* core *(n=105)*	*0.94±0.11	*0.41±0.09	*0.84±0.08	*0.059±0.007
TCFA *(n=52)*	*1.60±0.20	*1.24±0.24	*1.95±0.30	*0.142±0.016

Values are reported as the means±SE, *p<0.001 versus early core. The number in parenthesis represent the number of lesions examined;the total number= 365. MΦ = macrophages

Kolodgie FD, et al. New Engl J Med 2003

Necrotic Core Formation

Mechanism(s) and Molecules

Early Necrosis

engulfment:

- Early foam cell apoptosis (via ER stress path
- Clearance by phagocytosis (efferocytosis)

defective engulfment: (molecular genetic causation studies in mice)

Late Necrosis

Excess foam cell apoptosis

Defective efferocytosis

1) Fas ligand (apoptosis stimulating fragment)
2) transglutaminase-2
3) lactadherin
4) Mertk (Mer receptor tyrosine kinase)

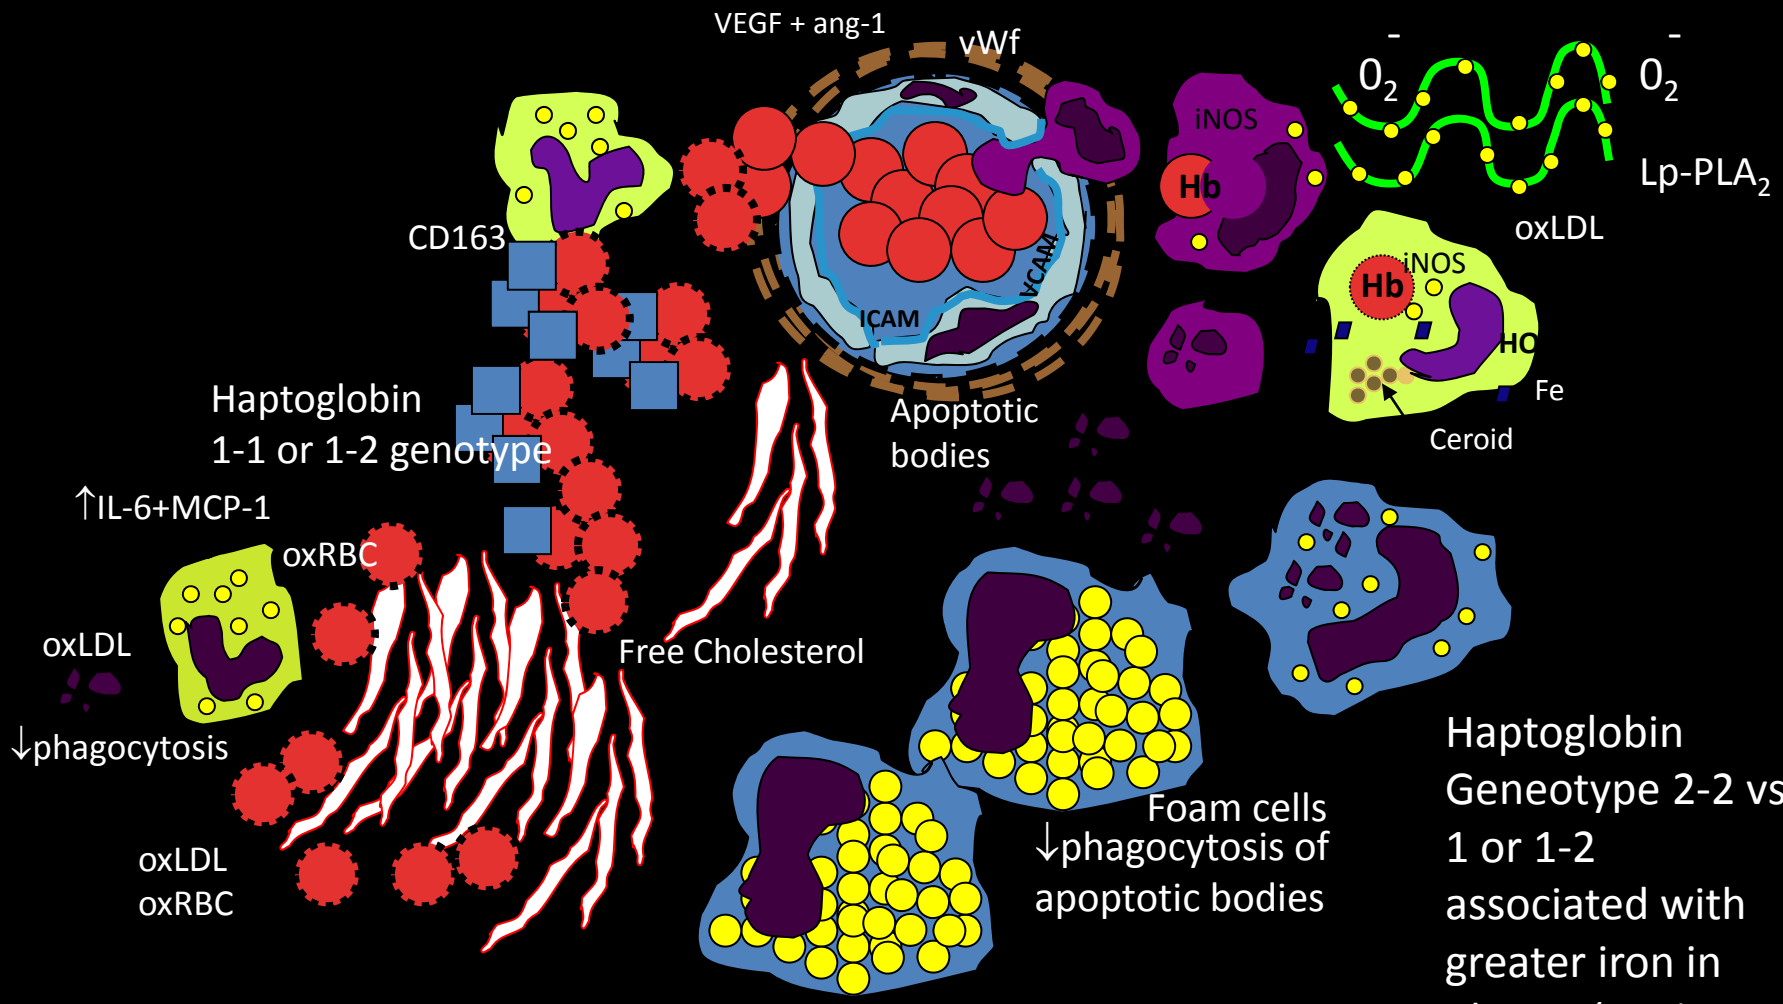
Hemorrhagic Necrosis

Excess

- free cholesterol
- free hemoglobin (Hb)
- macrophages

efferocytosis

Role of Vasa Vasorum in the leakage of RBC into the plaque and macrophage activation



Haptoglobin Geneotype 2-2 vs.1-1 or 1-2 associated with greater iron in plaque (46% vs.12%) among T2D

Fibrin
Calcified Plate fragmenation from artery torturocity and beating heart
Nodules of calcium Destroying the media
Medial destruction
Luminal thrombus surrounded by Fibrin and platelet

Inflammation: The Road to Plaque Progression

Summary:

- The earliest lesion of plaque progression is Pathologic Intimal thickening.
- PIT, lipid pool is converted to necrotic core from macrophages infiltration and apoptosis leading to early necrotic core formation.
- Late necrotic core is likely the result of defective efferocytosis as well as plaque hemorrhage which contribute to free cholesterol within necrotic core
- Inflammation continues to increase as plaques progress and is maximum in plaque rupture.

Summary: Thrombosis

- Plaque rupture is a main cause of thrombosis (65-70%), while other minor causes include erosion (30%) and calcified nodule (4-7%).
- Vulnerable plaques (TCFA) is a likely precursor lesions of rupture. Macrophage infiltration play an important role in modification of plaque vulnerability.
- Plaque hemorrhage from “leaky” vasa vasorum is an important contributor to the enlargement of the necrotic core.
- Calcified nodules is another substrate for thrombosis, especially in elderly male individuals with high plaque burden, tortuous arteries, diabetes , metabolic syndrome, hypertension, and smoking.
