# TAVR, Conduction Disturbances and Pacemakers

#### **Overview and Recommendations**

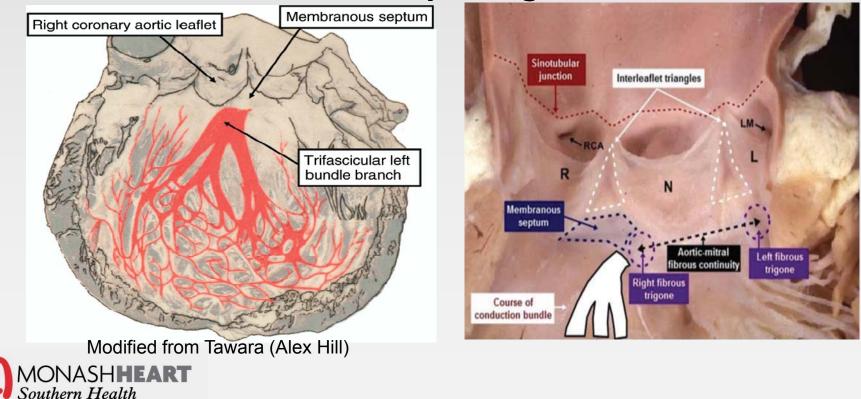

#### Background

- Factors Affecting Pacemaker
   Implantation
- Implant Best Practices
- Future Advancements
- Conclusions

# Background

Given the anatomical proximity of the aortic valve to the conduction system the occurrence of conduction abnormalities and the need for permanent pacemakers in patients undergoing SAVR or TAVR is not surprising

# Aortic Valve Replacement and Conduction Disorders

Permanent pacemaker (PM) implantation rates with aortic valve replacement:

 Surgical Aortic Valve Replacement (SAVR): 7.2%<sup>1</sup> (Range: 3.2% - 8.5%)

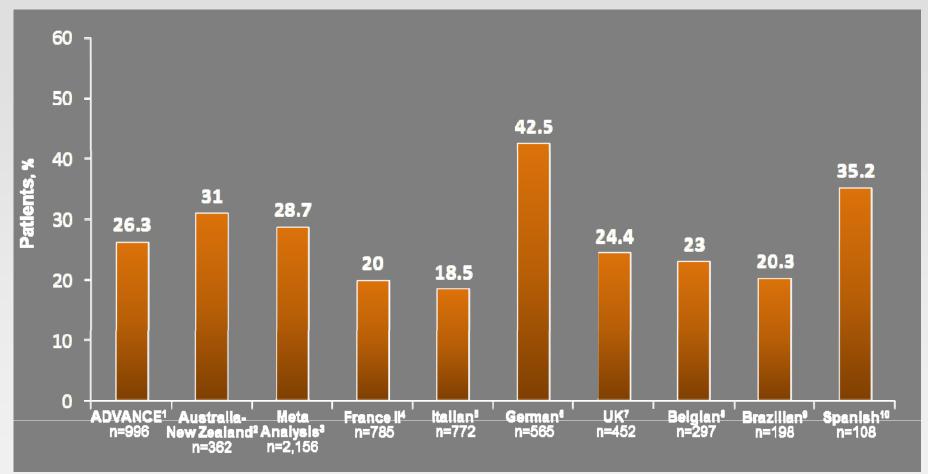

Transcatheter Aortic Valve Implantation (TAVI): 15% <sup>2</sup> (Range: 0 – 47%)

1. Bates MGD Interact CardioVasc Thorac Surg 2011;12:243-253. (Median)

2. Erkapic D. J Cardiovasc Electrophysiol ; November 2011 In Press (Crude Estimate).

#### Background

- Factors Affecting Pacemaker
   Implantation
- Implant Best Practices
- Future Advancements
- Conclusions

#### Factors Influencing Conduction Disturbances

#### **Patient History**

- ♥ Age
- Poor LVEF
- Preoperative AR
- Previous MI
- Pre-existing conduction disorders / RBBB<sup>1,2,3,4</sup>
- Pulmonary hypertension
- Landing zone calcification <sup>5</sup>

#### **Patient Anatomy**

- ♥ Narrow LVOT<sup>6</sup>
- Location of the AV node
- Length and configuration of the membranous septum
- ♥ Septal wall thickness<sup>7</sup>

Am Heart J 2009;157:860-866.

#### **Pre-existing RBBB Conduction Disorders**

Many studies have validated the presence of right bundle branch block (RBBB) before TAVI is a significant preprocedure predictor for the development of complete atrioventricular (AV) block and subsequent PM

1.358 Odds Ratio (p=0.02) RBBB significant predictor of PM	Erkapic 2011 <sup>1</sup> : Meta analysis of 5,258 TAVI patients
6.132 Odds Ratio (p=0.046) RBBB significant predictor of PM	Fraccaro 2011 <sup>2</sup> : 70 CoreValve patients
47.6% PM rate with RBBB and 10% PM rate without RBBB (p=0.01)	Munoz-Garcia 2010 <sup>3</sup> : 65 CoreValve patients
28.8% PM rate with RBBB and 2.7% PM rate without RBBB (p<0.0001)	Calvi 2011 <sup>4</sup> : 181 CoreValve patients

# **TAVI Procedural Factors**

#### Pre-Deployment<sup>1,2,3</sup>

- BAV balloon type and size
- BAV balloon size
- **Wire stiffness and location**
- Balloon: Annulus ratio
- **V** BAV balloon over-dilation
- Valve and annulus ratio

#### **Deployment**<sup>1,4,5,6,7,8</sup>

- Depth of implant
- Positioning of balloon catheter and valve
- Process and timing of repositioning

### Balloon Aortic Valvuloplasty (BAV)

BAV Impact on Conduction Disorders Prior to TAVI				
46% New conduction abnormalities during BAV procedure	<u>Nuis</u> <sup>1</sup> : 65 CoreValve patients. The timing and mechanism of new conduction abnormalities were identified during the TAVI procedure. These abnormalities were not necessarily associated with PM implants.			
<ul> <li>1.5% PM rate associated with BAV<sup>2</sup></li> <li>8.5% New conduction abnormality with BAV</li> </ul>	<u><b>Laynez</b></u> <sup>2</sup> : 271 BAV patients. The ratio of balloon size to the left ventricular outflow tract diameter was associated with conduction disturbances (over sizing caused conduction disturbances).			
9% PM rate associated with BAV <sup>3</sup>	<b>Baan<sup>3</sup>:</b> 34 CoreValve patients. Incidence of complete heart block and need for PM were identified after BAV and after the TAVI procedure.			
16.1% Absolute increased PM rate with BAV	<b><u>Grube</u></b> <sup>4</sup> : 60 CoreValve patients PM rate: 11.7% without BAV and 27.8% with BAV

# Depth of Implant

Odds Ratio Results	Study Examples
1.17 OR (p=0.003)	<b>Giannini</b> <sup>1:</sup> 275 CoreValve patients. Depth of prosthesis implantation was an independent predictor of PM implant.
1.15 OR (p=0.001)	<b>Munoz-Garcia</b> <sup>2:</sup> 181 CoreValve patients. Depth of prosthesis implantation was an independent predictor of PM implant.
1.21 OR (p=0.039)	<b>Fraccaro</b> <sup>3</sup> : 70 CoreValve patients: Depth of prosthesis implantation was an independent predictor of PM implant.
1.12 OR (p=0.03)	<b>Valera</b> <sup>4</sup> 26 CoreValve patients. Depth of prosthesis implantation was the <b>only</b> independent predictor of PM implant
1.37 OR	<b>Saia</b> <sup>5</sup> : 73 CoreValve patients. Distance between non-coronary cusp and the distal edge of the prosthesis was independent predictor of PM implant.

# Valve Procedural Differences

- CoreValve frame height 50mm. Although there is control over positioning during deployment, if the valve extends further into the LVOT, it may cause conduction disorders.<sup>1-5</sup>
- The Edwards SAPIEN XT value -17mm alothough positioning dependent on stability by pacing during balloon expansion, the frame height potentially minimises value depth options.

15 mm past annulus

5 mm past annulus

Images from porcine heart.

#### **TAVI and Pacemaker Clinical Practices**

#### Potential Lower Threshold for PM Implant with TAVI

- Temporary epicardial pacing used after SAVR allows time for conductive tissue to recover
- With TAVI, concerns about infection may prompt physicians to early pacemaker implantation
- Lack of knowledge about evolution of new onset conduction bradycardia and left bundle branch block and their prognostic impact<sup>1,2</sup>
- Variable and unknown pacing practices with TAVI patients<sup>1,2,3</sup>

#### **Potential Economic Factors**

 May be financial advantageous to implant a pacemaker rather than hospitalizing the patient for watchful waiting (reduce length of stay)<sup>4</sup>

# ESC Pacing Guidelines for Acquired AV Block

- Third- or second-degree (Mobitz I or II) atrioventricular block: (i) after catheter ablation of the atrioventricular junction (ii) after valve surgery when the block is not expected to resolve (Class I) C Evidence
- 2. Chronic symptomatic third- or second-degree (Mobitz I or II) atrioventricular block (Class I) C Evidence
- 3. Asymptomatic third- or second-degree (Mobitz I or II) atrioventricular block (Class IIa) C Evidence
- 4. Symptomatic prolonged first-degree atrioventricular block (Class IIa) C Evidence
- Neuromuscular diseases (e.g. myotonic muscular dystrophy, Kearns–Sayre syndrome, etc.) with third- or second-degree atrioventricular block (Class I) B Evidence
- 6. Neuromuscular diseases (e.g. myotonic muscular dystrophy, Kearns–Sayre syndrome, etc.) with first-degree atrioventricular block (Class IIb) B Evidence

Vahanian A. European Heart Journal 2007;28:2256-2295.

- It is not known how uniformly these pacemaker guidelines are followed for TAVI patients.
- Many published TAVI studies do not identify the reasons for pacemaker implants.<sup>1</sup>
- The most common published reasons for implanting pacemakers in TAVI patients are for AV block II or III.<sup>1</sup>

Erkapic D. J Cardiovasc Electrophysiol November 2011; In Press.

Southern Health

#### Assess Need for Pacemaker Prior to TAVI

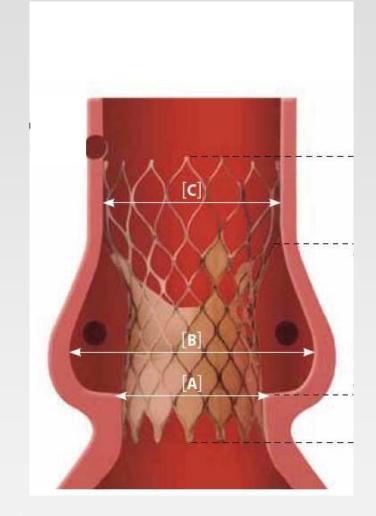

- Clinical practices vary and strongly influence pre-TAVI PM rates
- Proactively treating patients who have pacemaker needs prior to the TAVI procedure could reduce post-TAVI PM rates

Study	Pre-TAVI PM Rate	
PARTNER B Trial <sup>1</sup>	22.9%	
UK Registry <sup>2</sup>	8%	
Italian Registry <sup>3</sup>	6.3%	

- 1. Smith CR. N Engl J Med 2011;364(23):2187-2198.

- 3. Tamburino C. Circulation 2011;123(3):299-308.

#### **Depth of Implant Recommendation**

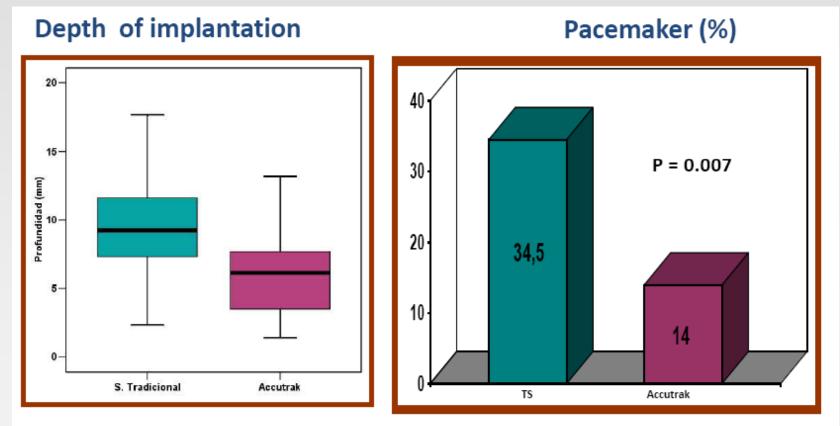

Distance of the lower edge of the noncoronary cusp to the valve inflow edge should be < 6 mm<sup>1</sup>

Valve should be implanted in a superior location within the LVOT

# AccuTrak Study Results<sup>1</sup>

Conclusion: AccuTrack System helped reduce the depth of the valve implant and lower the pacemaker implant rate

9.6 ±3.1 mm vs. 6.5 ±3.1; p < 0.001

MONASHHEART 1. Munoz-Garcia PCR 2011 Southern Health

#### Background

- Factors Affecting Pacemaker
   Implantation
- Implant Best Practices
- Future Advancements
- Conclusions

# Future Advancements in TAVI Technology

- Improved stability
- Improved control and ergonomics
- Refinements in valve sizing
- Full repositionability

- Background

   Implantation
- Implant Best Practices
- Future Advancements
- Conclusions

# Conclusions

- Given the anatomical proximity of the aortic value to the conduction system, pacemaker implants are a known complication of aortic value replacement procedures.
- There are some differences between the currently available technologies with respect to the PPM requirement
- Depth into the LVOT may cause conduction disorders and increase the PM rate.<sup>1-5</sup> CoreValve PM rate (25.8%)<sup>6</sup> has been reduced when the depth of implant is kept under 6 mm and the AccuTrak delivery system is used optimize the position and depth of the valve (12% to 14%)<sup>7,8,9</sup>.
