Heart Team Approach to UPLM or Complex CAD

Anatomic Setting	COR	LOE
UPLM or Complex CAD	I – Heart Team Approach	C
UPLM or Complex CAD	IIa – Calculation of the STS and SYNTAX scores	B

UPLM PCI to Improve Survival (SIHD)

Risk of PCI Complication	Likelihood of Good Long-term Outcome	CABG Mortality Risk	COR	LOE
Low 	Hi 	Hi 	<p>Ila—For SIHD when <i>low</i> risk of PCI complications and <i>high</i> likelihood of good long-term outcome (e.g., SYNTAX score of ≤ 22, ostial or trunk left main CAD), and a <i>significantly increased</i> CABG risk (e.g., STS-predicted risk of operative mortality $\geq 5\%$)</p>	B
			<p>Ilb—For SIHD when <i>low to intermediate</i> risk of PCI complications and <i>intermediate to high</i> likelihood of good long-term outcome (e.g., SYNTAX score of < 33, bifurcation left main CAD) and <i>increased</i> CABG risk (e.g., moderate-severe COPD, disability from prior stroke, prior cardiac surgery, STS-predicted operative mortality $> 2\%$)</p>	B
Hi	Low	Low	<p>III: Harm—For SIHD in patients (versus performing CABG) with <i>unfavorable</i> anatomy for PCI and who are <i>good</i> candidates for CABG</p>	B

UPLM PCI to Improve Survival (ACS)

COR	LOE
IIa—For UA/NSTEMI if not a CABG candidate	B
IIa—For STEMI when distal coronary flow is <TIMI grade 3 and PCI can be performed more rapidly and safely than CABG	C

The Evidence

SYNTAX Trial Design

 62 EU Sites +  23 US Sites

De novo 3VD and/or LM (isolated, +1,2,3 VD)

Limited Exclusion Criteria

Previous interventions , Acute MI with CPK>2x, Concomitant cardiac surgery

Heart Team (Surgeon & Interventional Cardiologist)

Amenable for both
treatment options

Amenable for only one
treatment approach

Stratification:
LM and Diabetes

Randomized Arms
N=1800

Two Registry Arms
N=1275

MACCE to 3 Years in Patients with UPLMCA Disease

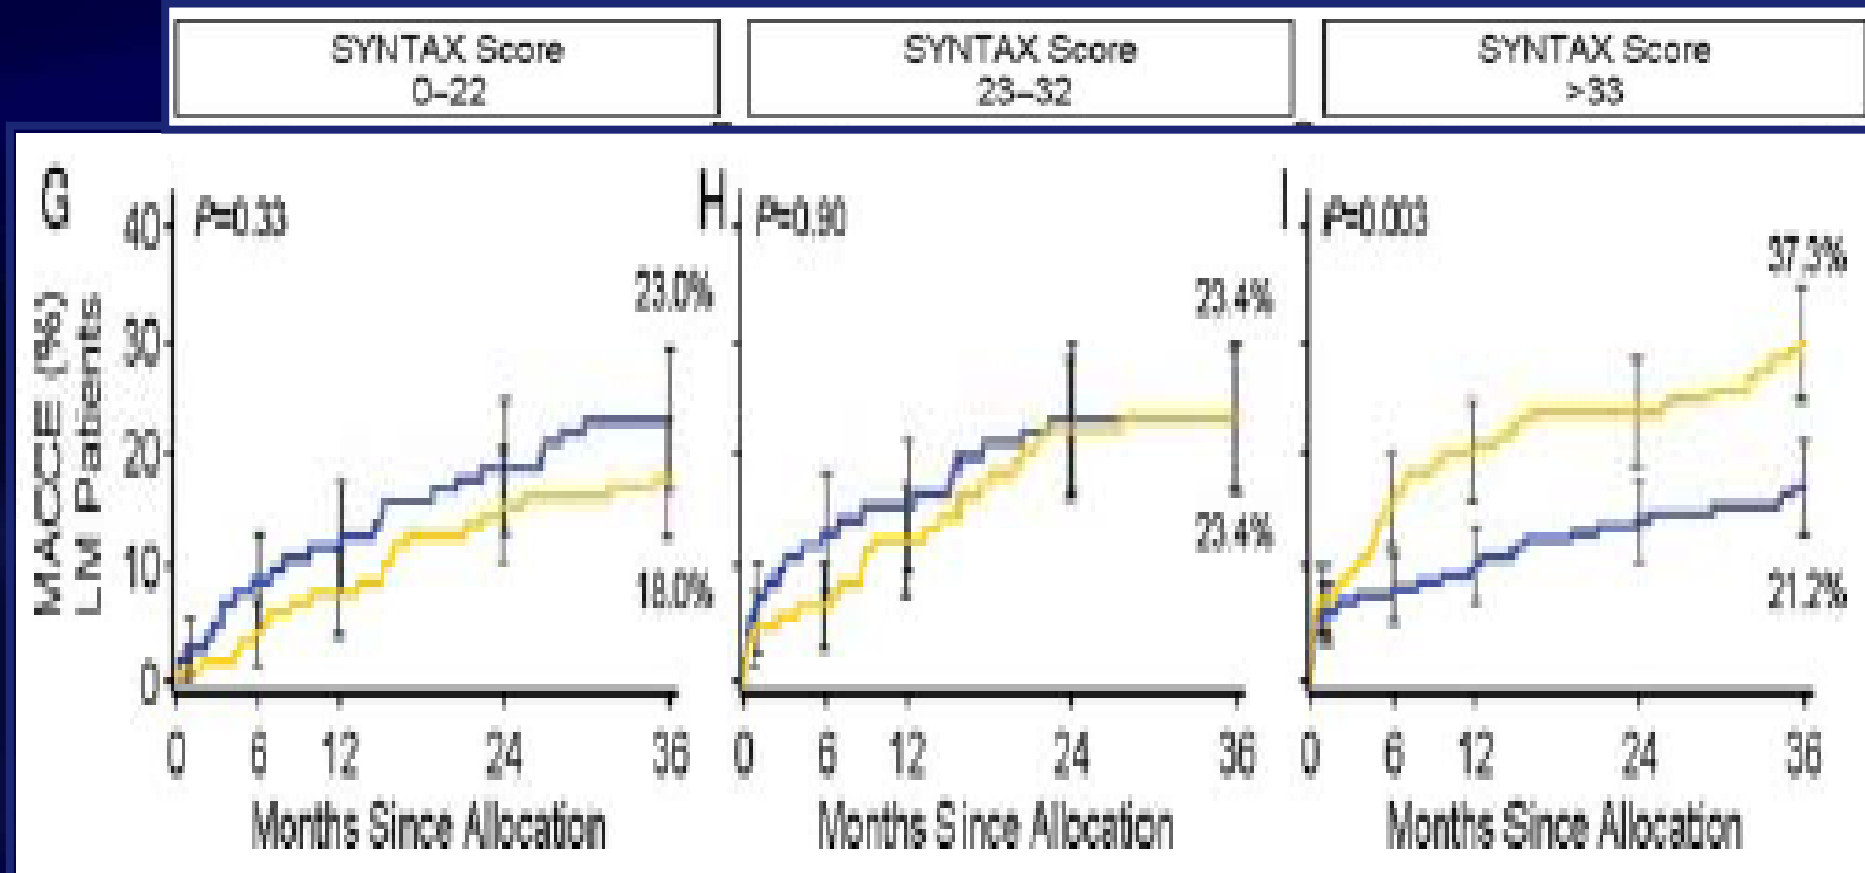

(All Syntax Patients)

B Left Main Disease (n=705)

MACCE to 3 Years in Patients with UPLMCA Disease

According to SYNTAX Score

PCI vs. CABG for UPLMCA Disease

A Meta-Analysis of Randomized Clinical Data

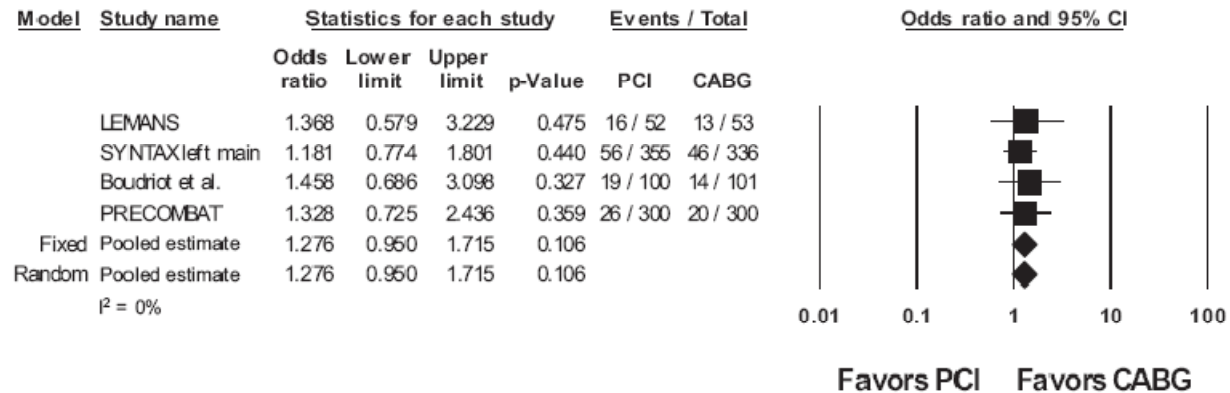

Table 1 Studies Included in the Meta-Analysis

Study/First Author (Ref. #)	Year	Design	N	PCI, n	DES, %	CABG, n	LIMA to LAD, %	Primary Outcome
LEMANS (4)	2008	RCT	105	52	35	53	81	Cardiac death, MI, CVA, repeat revascularization, and/or acute/subacute in-stent thrombosis
SYNTAX Left Main (5)	2009	Pre-specified subanalysis from RCT	705	357	100	348	97	All-cause death, CVA, MI, and repeat revascularization
Boudriot et al. (8)	2010	RCT	201	100	100	101	99	All-cause death, MI, and repeat revascularization
PRECOMBAT (9)	2011	RCT	600	300	100	300	94	All-cause death, CVA, MI, and repeat revascularization

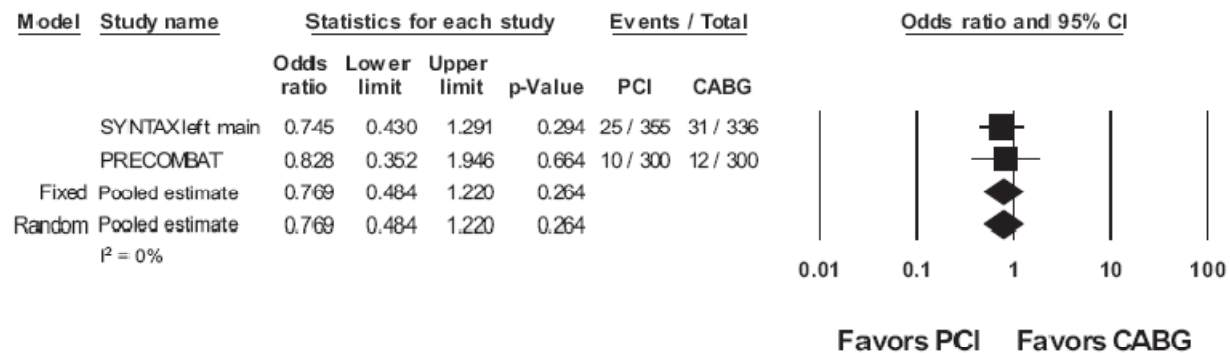

PCI vs. CABG for UPLMCA Disease

A Meta-Analysis of Randomized Clinical Data

Major Adverse Cardiac and Cerebrovascular Events

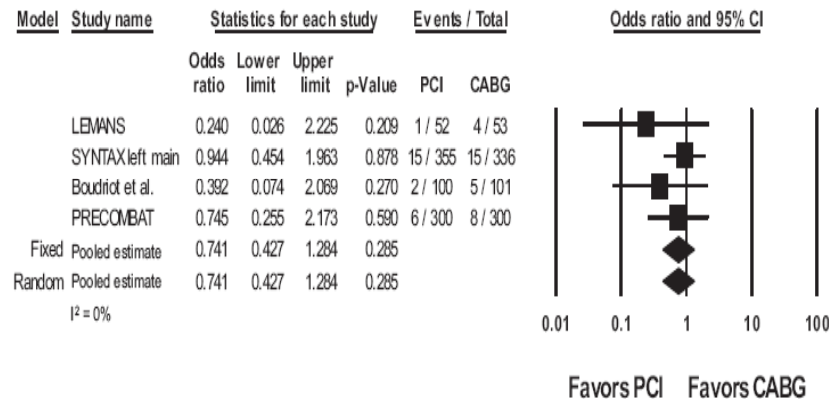

Death, Myocardial Infarction or Stroke

PCI vs. CABG for UPLMCA Disease

A Meta-Analysis of Randomized Clinical Data

Death

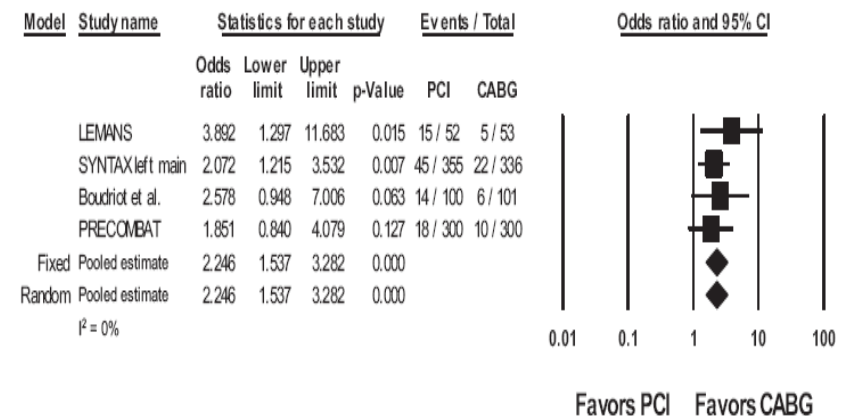

Stroke

Myocardial Infarction

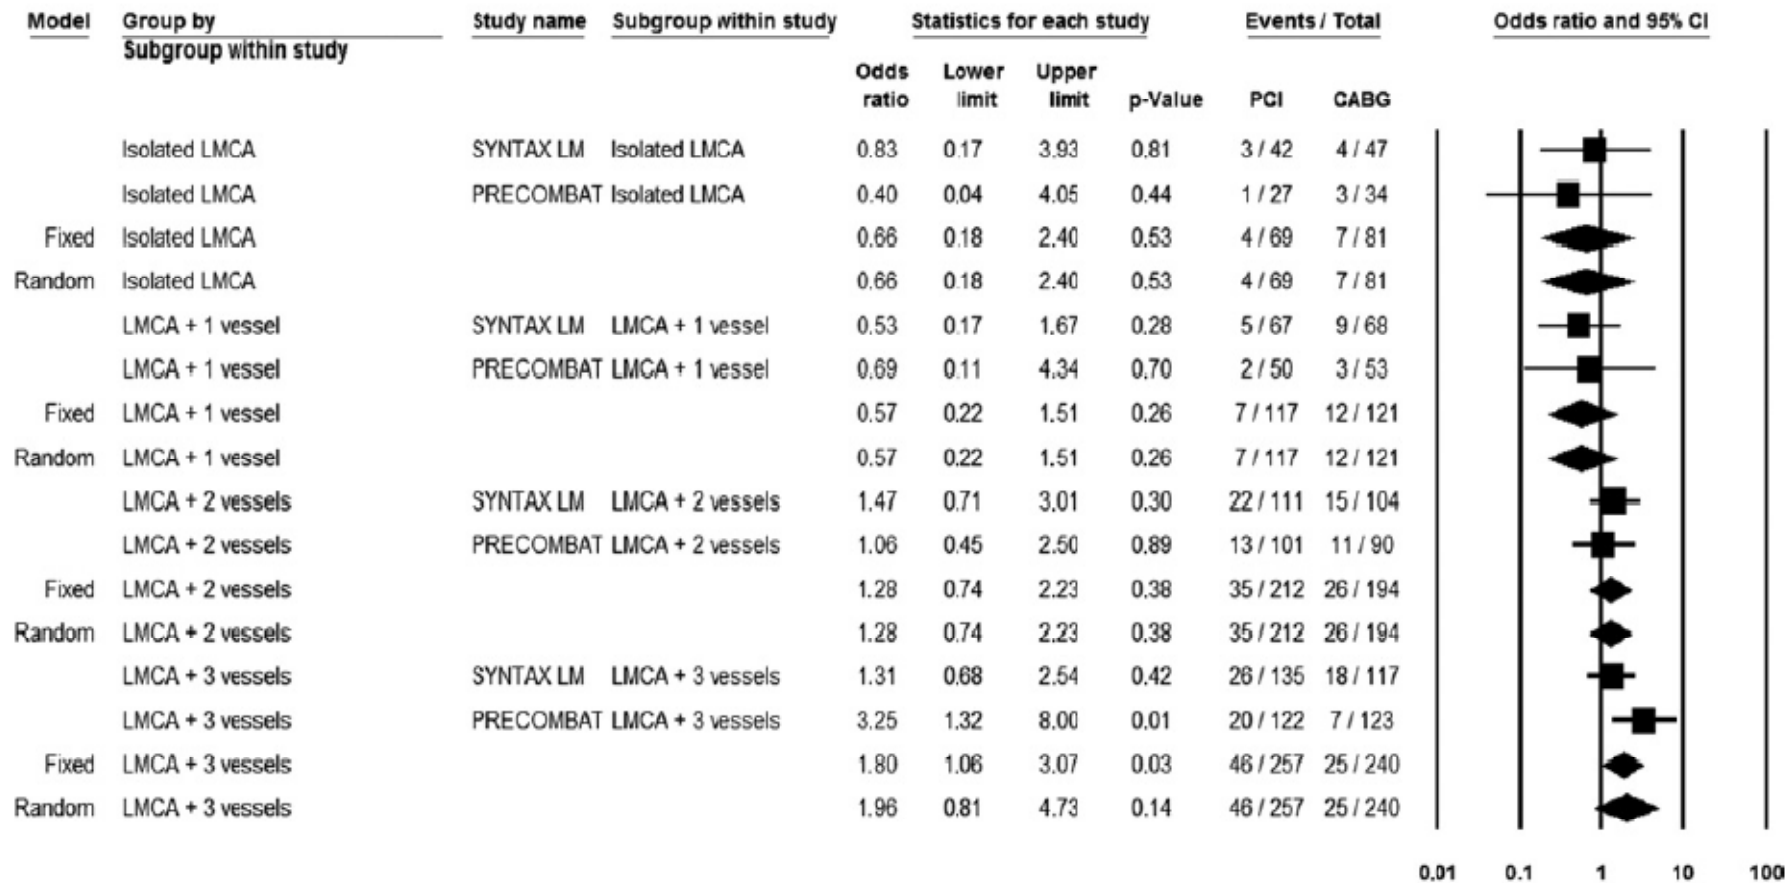

Repeat Revascularization

PCI vs. CABG for UPLMCA Disease

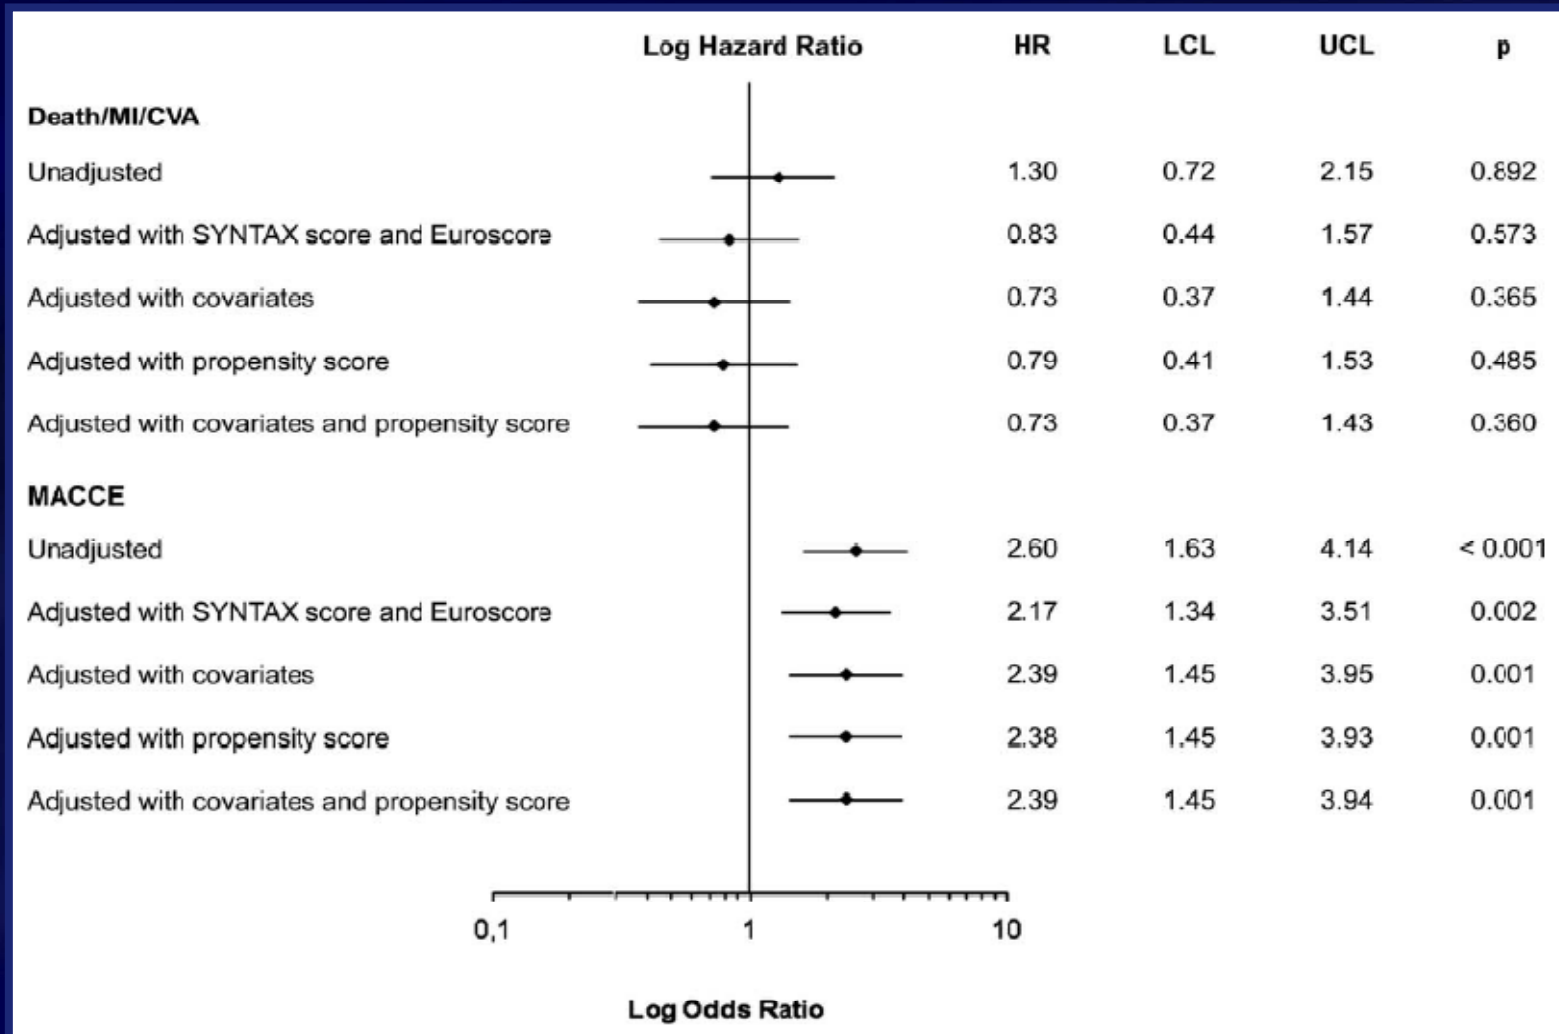

A Meta-Analysis of Randomized Clinical Data

Major Adverse Cardiac and Cerebrovascular Events

PCI vs. CABG for UPLMCA Disease with SYNTAX Score <32

A Propensity Score Matched 3-Year Comparison

**Do the Guidelines in the US Reflect the
Current State of Knowledge?**

NO

Remaining Questions

- What is the cause of the higher mortality after PCI in patients with LMCA and SYNTAX >32?
 - CABG benefit? (CABG did not reduce mortality in STITCH and BARI 2D compared to medical therapy)
 - TAXUS stents harm? (too many stents, high thrombosis and restenosis rate)
- What the impact of increasing co-morbidities on SYNTAX outcome? Can we apply the results to patients with STS score >5?
- Can new PCI strategies and 2nd generation devices change the outcome?
 - Use of FFR guided PCI in MVD improve outcome
 - 2nd generation stents have lower rates of thrombosis and restenosis
