

Paravalve Leak : Mechanism and Prevention

Hyo-Soo Kim MD, PhD
Cardiovascular Center,
Seoul National University Hospital,
Seoul, Korea

PVL, the new Achilles' heel?

Even **mild or moderate PVL** can **increase mortality**

> Mild AR increases mortality

PARTNER Cohort A *Sapien valve*
None/Trace (n = 135);
Mild (n = 165);
Moderate-Severe (n=34)

> Moderate AR increases mortality

ADVANCE Registry *CoreValve*
None (n = 166);
Mild (n = 551);
Moderate-Severe (n=132)

Kodali SK. et al. N Engl J Med 2012;366:1686-95

Linke A. et al. TCT 2012

Importance of multimodality approach

Each one can **potentially underestimate PVL** in a particular situation

Example: grading by circumferential extent

A

B

Circumference = 6"
AR = 0.1+0.35=0.45"
Ratio= 8%
Severity = Mild

Circumference = 6"
AR = 0.5+0.5=1.0"
Ratio= 17%
Severity = Moderate
(Trans AR also present)

Circumference = 6"
AR = 0.6+1.1=1.7"
Ratio = 28%
Severity = Severe

Mild
(<10%)

Moderate
(10-20%)

Severe
(>20%)

Note that the different cutoff of severe PVL (20%) according to VARC-1 definition

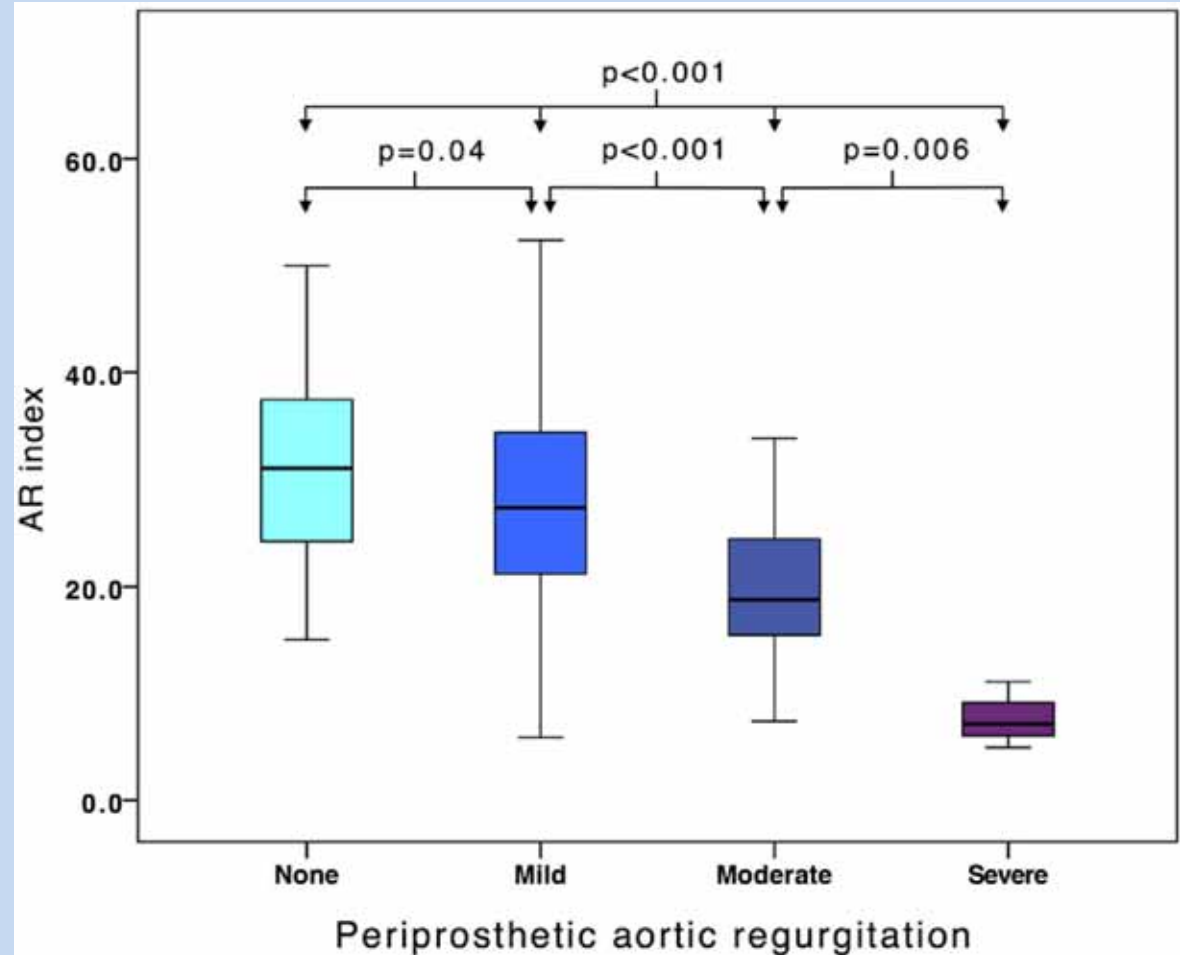

Severity of PVL (VARC 2): 2-D echo is a standard

Prosthetic aortic valve regurgitation			
	Mild	Moderate	Severe
<i>Semi-quantitative parameters</i>			
Diastolic flow reversal in the descending aorta (PW)	Absent or briefly early diastolic	Intermediate	Prominent, holodiastolic
Circumferential extent of prosthetic valve paravalvular regurgitation*	<10%	10-29%	≥30%
<i>Quantitative parameters</i>			
Regurgitant volume, ml/beat	<30ml	30-59ml	≥60ml
Regurgitant fraction	<30%	30-49%	≥50%
ERO area	0.10cm ²	0.10-0.29cm ²	≥0.30cm ²

*Not well validated and may overestimate the severity c/w the quantitative Doppler

Change of hemodynamics: LVEDP

$$\text{AR index} = [(\text{DBP} - \text{LVEDP}) / \text{SBP}] \times 100$$

AR index **can be complementary** to the echocardiographically assessed severity of PAL

Proposed Mechanisms of PVL

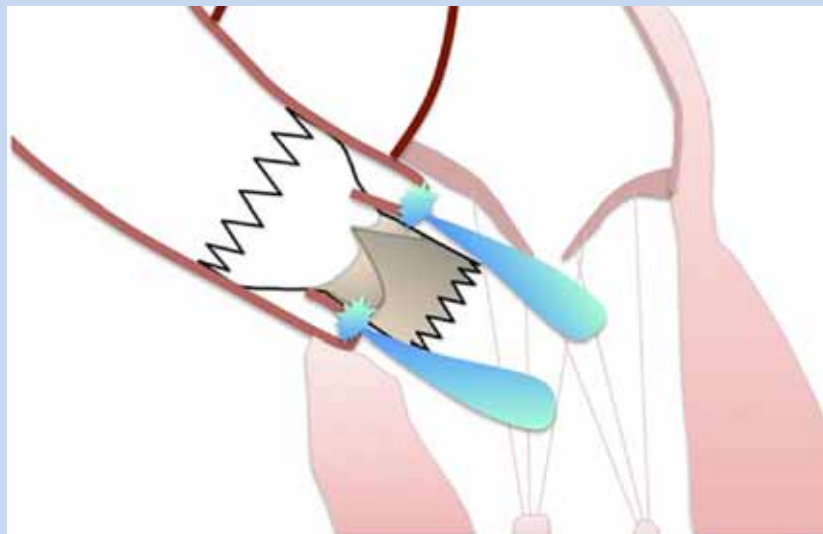

Calcification

Malposition – too shallow

Malposition – too deep

Size mismatch

Strategy to avoid PVL

1. Calcification → pre-procedural planning
or patient selection

2. Size mismatch → Accurate sizing

3. Malposition → Optimal positioning

4. Identification or quantification of PVL

5. Correction by additional intervention

Strategy to avoid PVL

1. Calcification → pre-procedural planning
or patient selection

2. Size mismatch → Accurate sizing

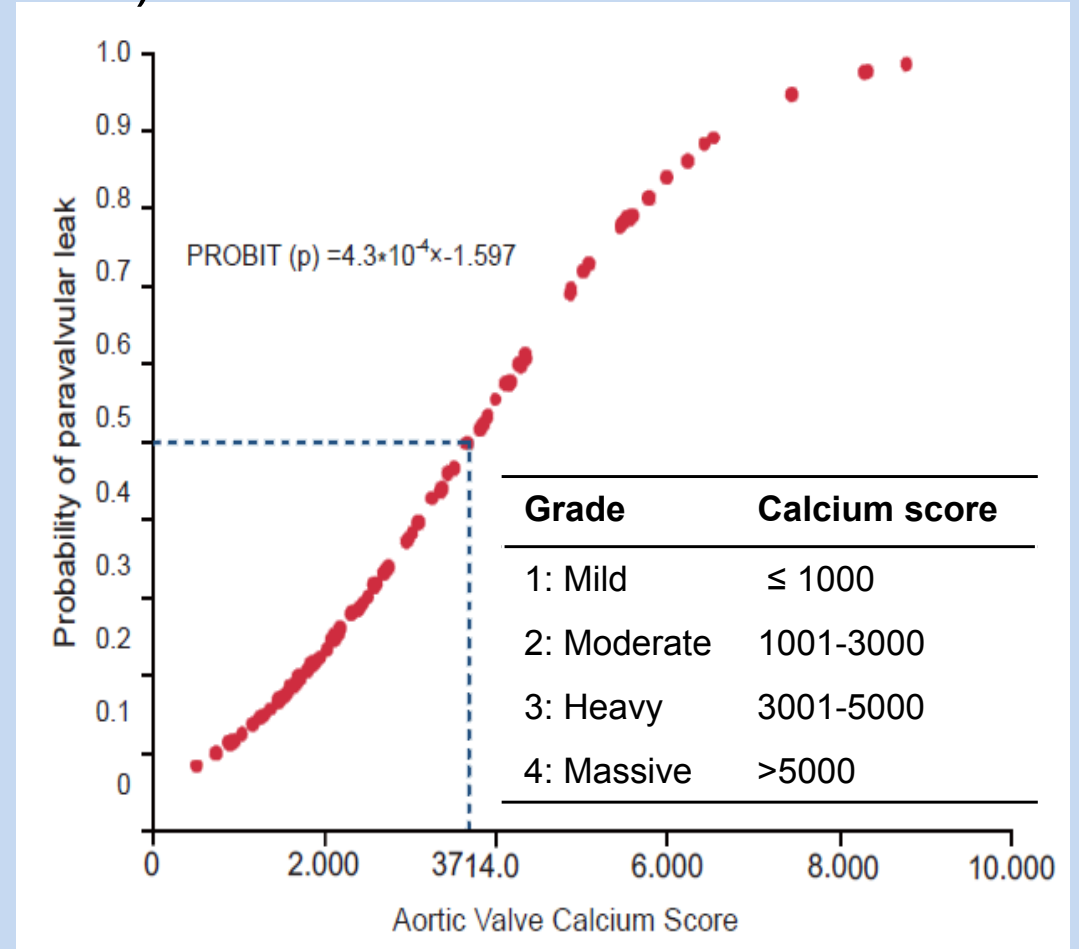

3. Malposition → Optimal positioning

4. Identification or quantification of PVL

5. Correction by additional intervention

Severity of Calcification

Balloon-expandable valve (Sapien Valve)

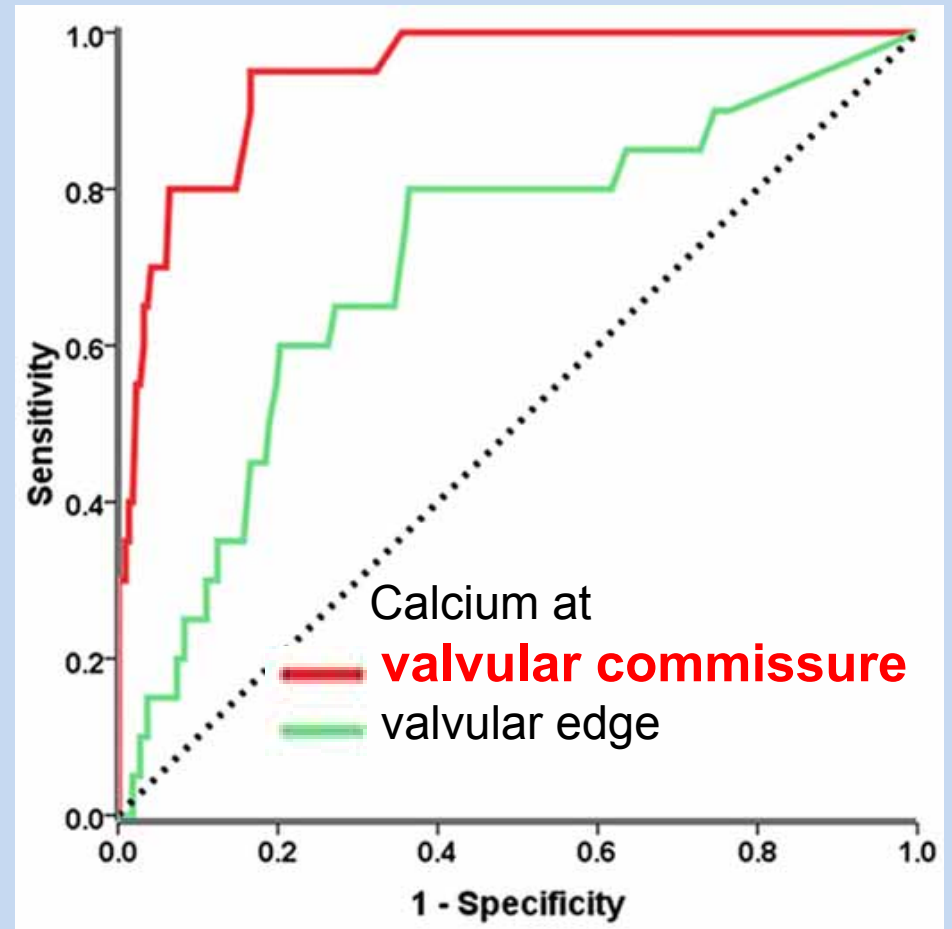

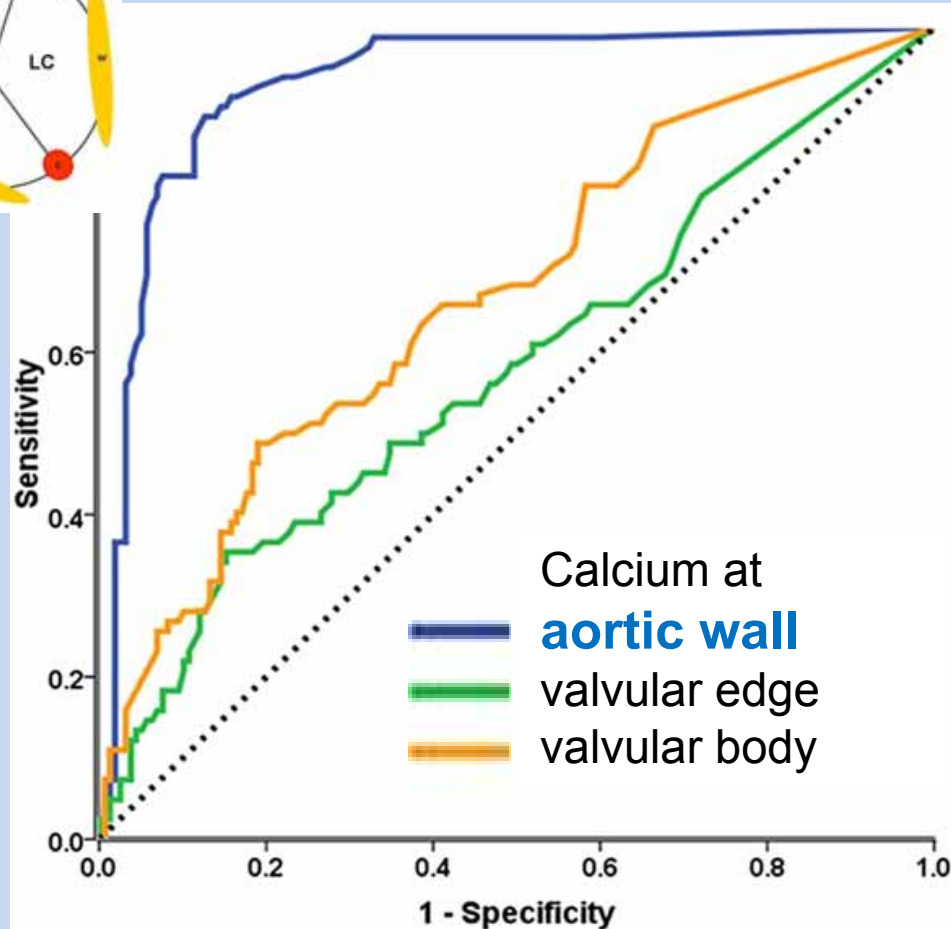

Severe AV calcification is predictive for postoperative relevant PVL

John D. et al. J Am Coll Cardiol Interv 2010;2,233-43

Haensig M. et al. Ann Cardiothorac Surg 2012;1(2):160-164

Location of Calcification

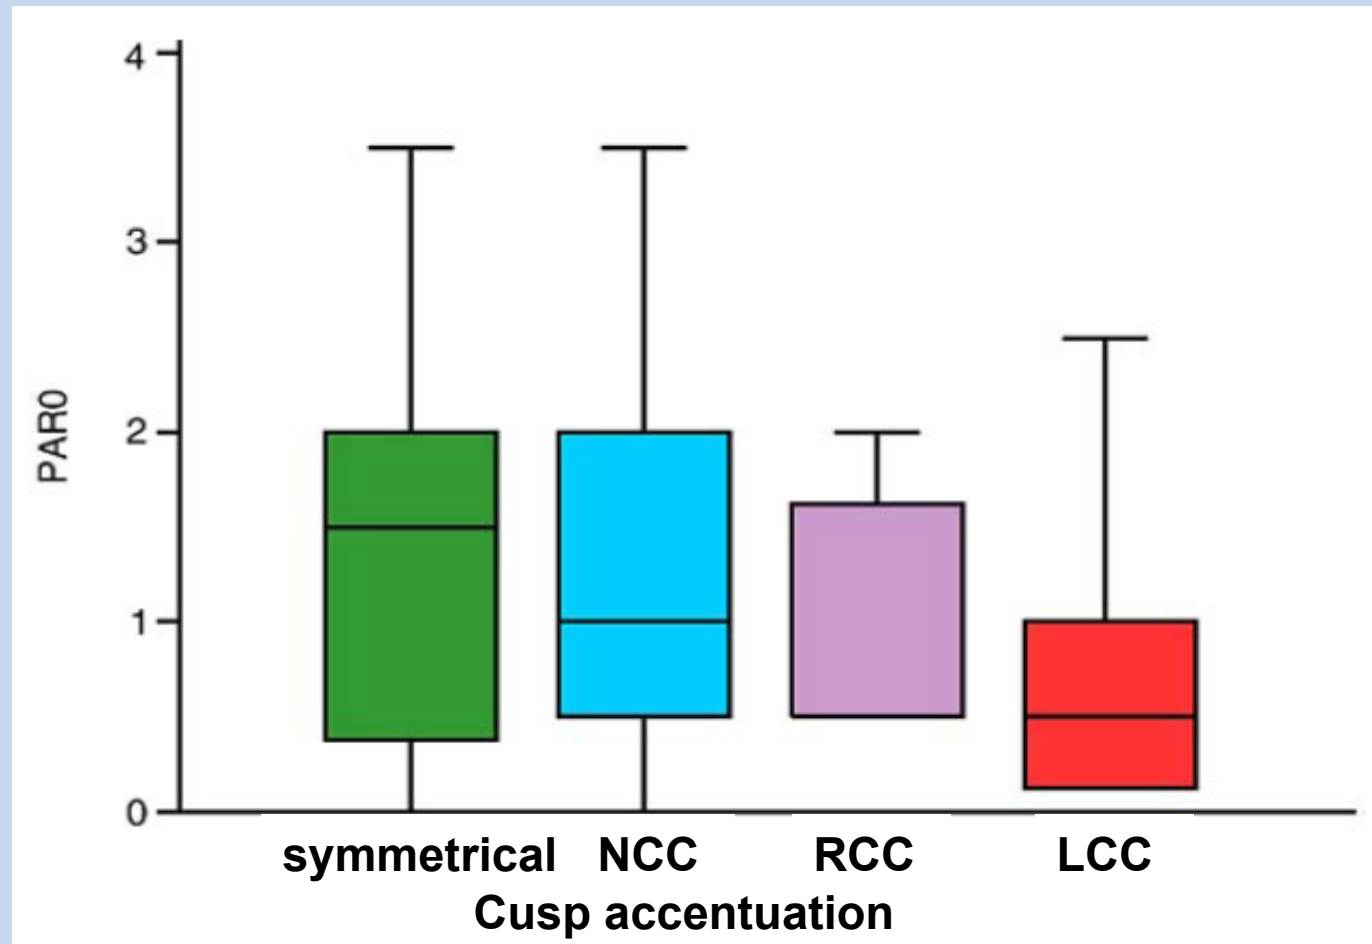

Balloon-expandable valve (Sapien Valve)

Aortic wall and commissure calcifications confer higher risk of PVL

Symmetry of Calcification

Self-expandable valve (CoreValve)

*PAR0: AV regurgitation assessed by angiography **acute after** release of the CoreValve

Visual distribution pattern of calcification is *not* related with PVL grade

SNUH Experience

Case 1

- Brief history: F/80
 - Chief complaint: aggravation of dyspnea
 - History of OMI, s/p PCI to LM-LCx
 - Complete AV block on pacemaker
- Cardiovascular risk factors
 - diabetes mellitus/hypertension/dyslipidemia (-/+/-)
- Laboratory findings
 - ECG: pacemaker rhythm
 - Echocardiography
 - normal LV size with normal LVEF (59%)
 - AV mean pressure gradient 39 mmHg, AV area 0.47 cm²
- Logistic EuroSCORE: 7.5%

Case 1

Calcification on MDCT

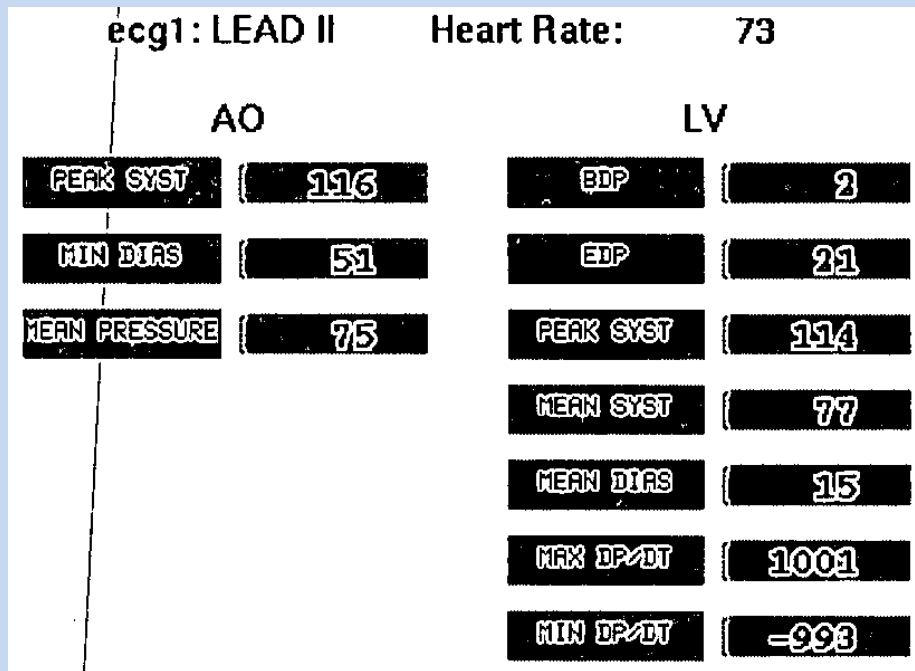

Case 1

PVL on angiography (CoreValve 26 mm)

Case 1

AR index by catheterization

$$\text{AR index} = (51 - 21) / 116 \times 100 = 26$$

Case 1

Valve position on angiography

Case 1

Valve position on angiography

RAO / caudal

RAO / caudal

Case 2

- Brief history: M/77
 - Chief complaint: aggravation of dyspnea
 - COPD
- Cardiovascular risk factors
 - diabetes mellitus/hypertension/dyslipidemia (-/-/+)
- Laboratory findings
 - ECG: NSR, LVH
 - Echocardiography
 - normal LV size with depressed LVEF (42%)
 - AV mean pressure gradient 45 mmHg, AV area 0.62 cm²
 - Diastolic dysfunction with increased LV filling pressure (E/e' = 35)
- Logistic EuroSCORE: 30.3%

Case 2

Calcification on MDCT

Case 2

PVL on angiography (CoreValve 31 mm)

LAO / caudal

RAO / caudal

Case 2

PVL on angiography (after post-dilatation)

NuMED 25 x 40 mm

RAO / caudal

Case 2

AR index by catheterization

265 / [17:00] LEFT VENTRICLE

HEART RATE	55	[bpm]
LV BDP	16	[mmhg]

$$\text{AR index} = (54 - 23) / 147 \times 100 = 20$$

Case 3

Valve position on angiography

AP / caudal

AP / caudal

Case 3

Valve position on angiography

RAO / caudal

RAO / caudal

Case 4

- Brief history: M/83
 - Chief complaint: aggravation of dyspnea
 - Colon cancer
- Cardiovascular risk factors
 - diabetes mellitus/hypertension/dyslipidemia (-/-/-)
- Laboratory findings
 - ECG: NSR
 - Echocardiography
 - normal LV size with depressed LVEF (53%)
 - AV mean pressure gradient 75 mmHg, AV area 0.68 cm²
- Logistic euroSCORE: 5.8%

Case 4

Calcification on MDCT

Case 4

Valve deployment (CoreValve 26 mm)

*Incomplete valve expansion at the portion of severe eccentric calcification

Case 4

PVL on angiography (CoreValve 26 mm)

We did not perform post-dilatation in this case:

High risk of complication, such as distal embolization or coronary obstruction

Relatively low benefit of procedure

Case 4

AR index by catheterization

107 / [14:16] LEFT VENTRICLE

HEART RATE	62	[bpm]
LV BDP	11	[mmhg]

AOV SEP	15	[sec/min]
AOV PEAK GRAD	9.9	[mmhg]
AOV MEAN GRAD	22.1	[mmhg]

$$\text{AR index} = (49 - 22) / 123 \times 100 = 22$$

Case 4

Valve position on angiography

Summary of Cases

	Degree of calcification	Distribution of calcification	PVL
Case 1	Mild		Trivial
Case 2	Severe	Concentric	Mild
Case 3	Severe	Eccentric	Moderate
Case 4	Severe	Eccentric (+ LVOT calcification)	Moderate

Hypothesis based on These Observations

Symmetric calcification

Asymmetric calcification

More PVL

Asymmetric calcification portends
higher risk of PVL

Three-Centers' Study on Calcification & PVL

Calcification

- 1) severity of calcification (quantitative)
distribution of calcification (symmetric vs. asymmetric)
- 2) angle between the axis of ascending aorta and the LVOT axis

PVL (paravalvular leakage after CoreValve TAVI)

- 1) assessed immediately after procedure
- 2) measured by left ventriculography (+ echocardiography)
- 3) cutoff: grade ≥ 3

Total number of patients = 66 CoreValve

- 1) SNU hospital
- 2) AMC
- 3) Singapore National Heart Center

Calcification & PVL

	All (n=63)	Grade <3 (n=48)	Grade ≥3 (n=15)	p value
Total calcium score (mean, IQR)	710±539 (569, 342-915)	578±420 (437, 305-851)	1246±647 (1032, 831-1361)	<0.001
Δ calcium score (mean, IQR)	268±300 (215, 92-381)	181±141 (166, 59-261)	620±482 (484, 414-607)	<0.001
Angle (mean, IQR)	160±10 (160, 154-165)	160±10 (160, 154-165)	158±9 (162, 150-166)	0.729

Values given as mean ± SD or number (percentage), unless otherwise indicated. Comparisons of continuous and categorical data were made by the Mann-Whitney U test and Fisher exact test, respectively.

Predictor of PVL (bivariate analysis)

Grade ≥ 3 PVL

	Odds ratio	P value	95% CI
Age, per year	0.961	0.366	0.880-1.048
Gender	0.825	0.757	0.245-2.785
DM	0.162	0.092	0.019-1.347
Smoker	5.000	0.070	0.879-28.440
STS	0.733	0.114	0.498-1.077
Mean PG, <i>per increase of 5 mmHg</i>	1.200	0.024	1.005-1.071
Procedure time	1.024	0.195	0.988-1.061
Total calcium score, <i>per increase of 100</i>	1.286	0.002	1.048-1.227
Δ calcium score, <i>per increase of 100</i>	3.893	<0.001	1.371-2.839
Angle	0.963	0.222	0.905-1.023

Unpublished data

Application on Aforementioned Cases

	Degree of calcification (Total calcium score)	Distribution of calcification (Calcium score difference)	PVL
Case 1	Mild (49.1)	Concentric (32.9)	Trivial
Case 2	Severe (1130.1)	Concentric (81.64)	Mild
Case 3	Severe (689.8)	Eccentric (354.0)	Moderate
Case 4	Severe (1943.0)	Eccentric (565.6)	Moderate

Calcification & PVL

- The degree of **eccentric calcification** is a better parameter to predict the risk of PVL than that of **total calcification**.
- **Baseline clinical variables** do not predict the risk of grade ≥ 3 PVL.
- The **LVOT-Aorta angle** is not a significant predictor of PVL in patients undergoing TAVI with CoreValve. (maybe due to the long height of device)

Endovascular & Coronary Revascularization in **Seoul**

ENCORE SEOUL 2014

SEPTEMBER 24(WED) ~ 26(FRI), 2014

COEX CONVENTION CENTER, SEOUL, KOREA

Course Directors

Take home messages for PVL

1. Comprehensive assessment of **calcification**
- Severity, location, eccentricity

2. Proper **sizing** for procedure
- 3-D reconstruction (MDCT, 3D-EchoCG)
- Modest over-sizing

3. Optimal **positioning**
- Landmark (eq. NCC)

4. **Identification or quantification** of PLV
- Supra-skirtal or true paravalvular regurgitation
- TEE, Aortography, and Ao-Pulse Pr. (ARi)

5. **Correction**
- Balloon post-dilatation, valve-in-valve technique

Baseline clinical characteristics (1)

Calcium area measurement

- Threshold of calcification : 700 HU on enhancement images
- Area of pixels over threshold
- Each half of the valve

Aortic valve calcification asymmetry assessment

- Stand alone 3D workstation
- Diastole phase images
- Perpendicular planes of aortic root
- Slice thickness 1 mm
- Slice interval 1 mm
- Number of images 30

Angle measurement

- Angle between aortic root axis and LVOT axis
- Measure angle in maximum distorted alignment

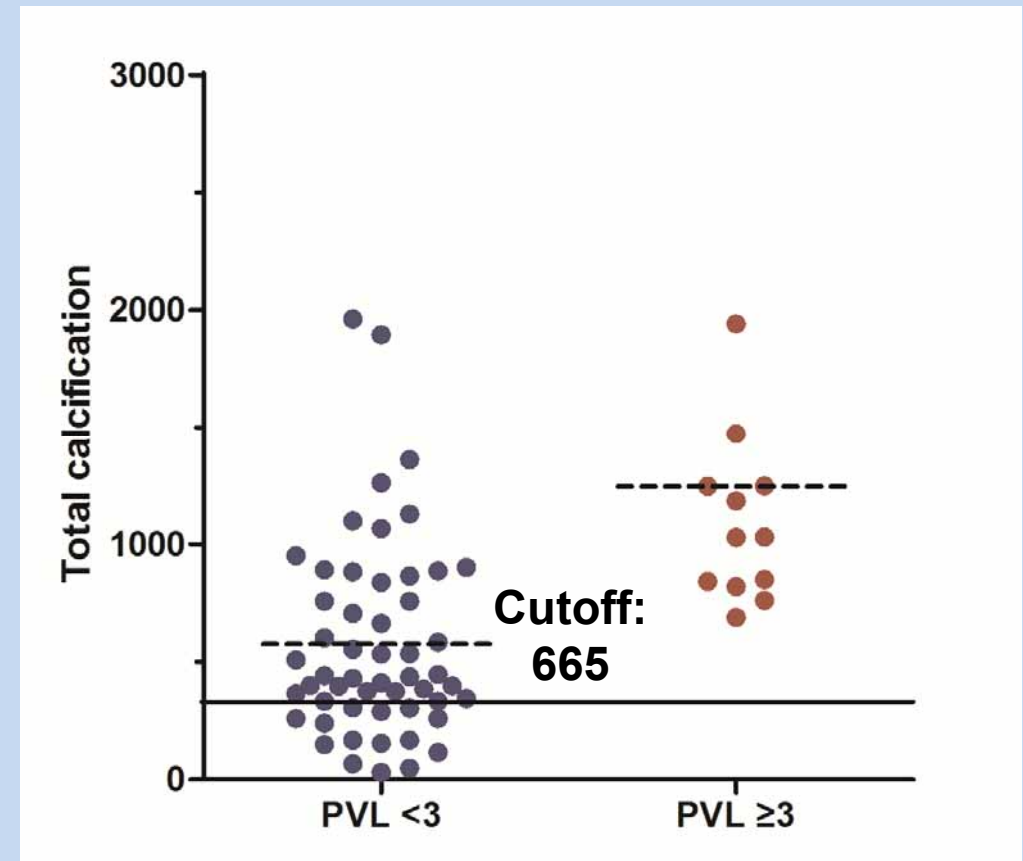

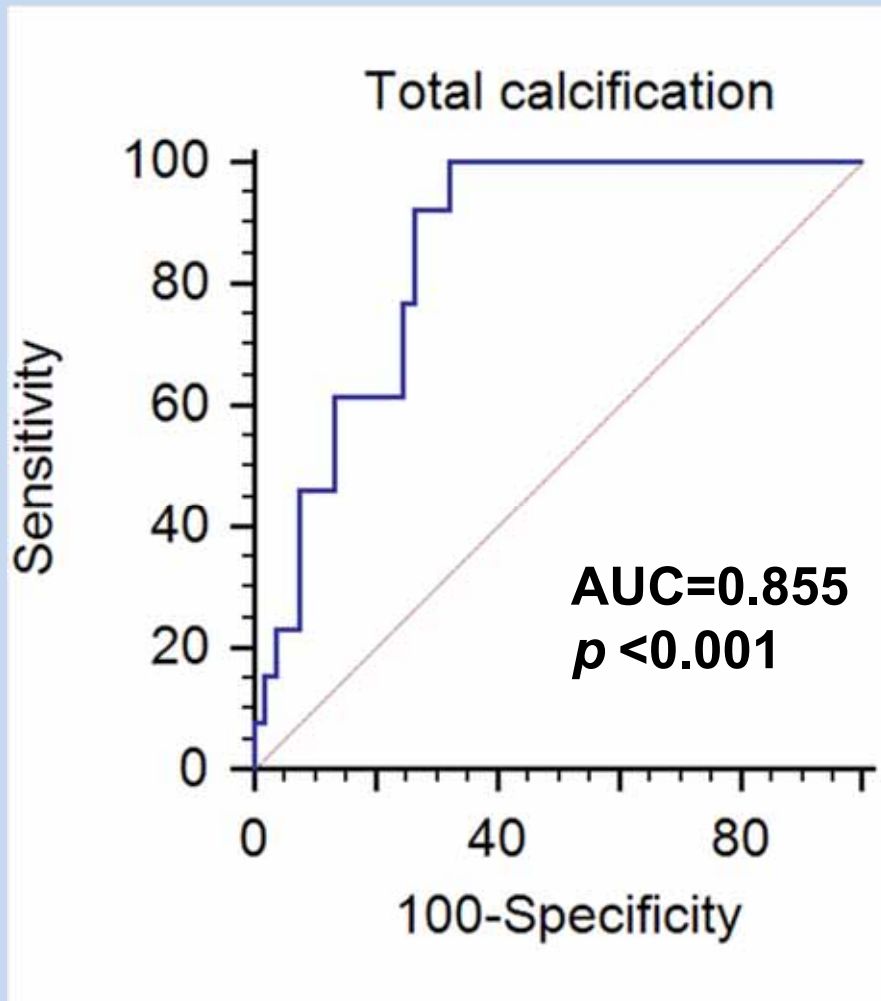

Predictor of PVL (multivariate analysis)

Grade ≥ 3 PVL
