Managing the post intervention period … Which therapies ?

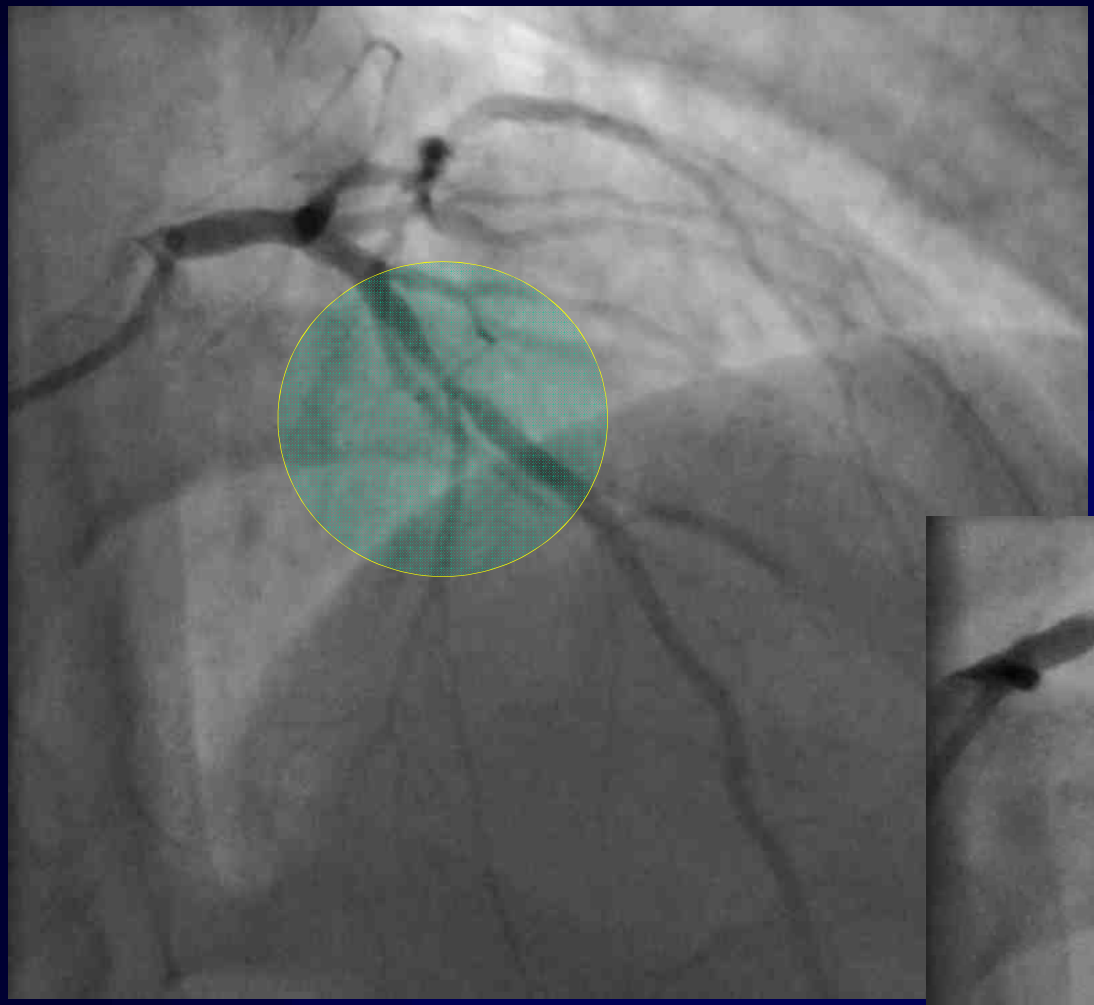
{Beyond anti-platelets}

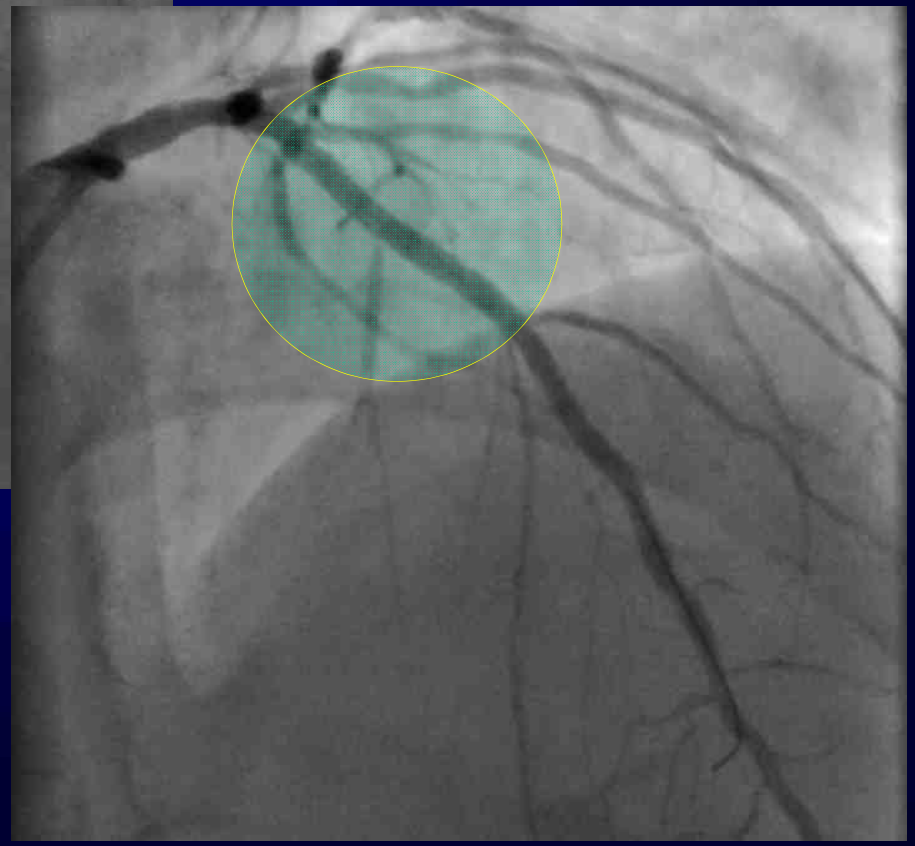
Tony Gershlick

Professor of Interventional Cardiology

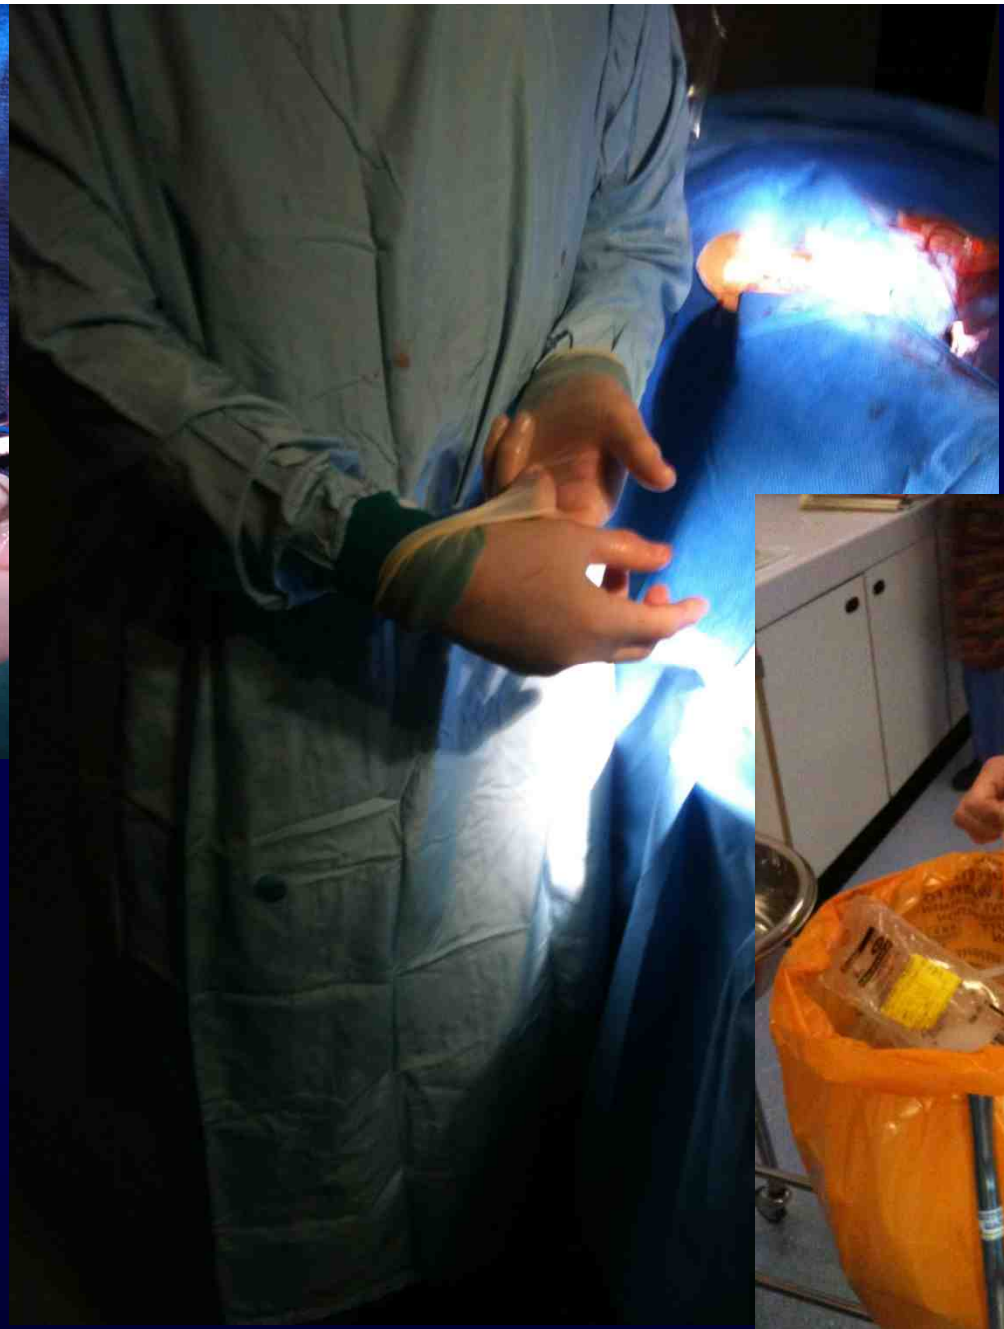
University Hospital of Leicester UK

Korea 2010

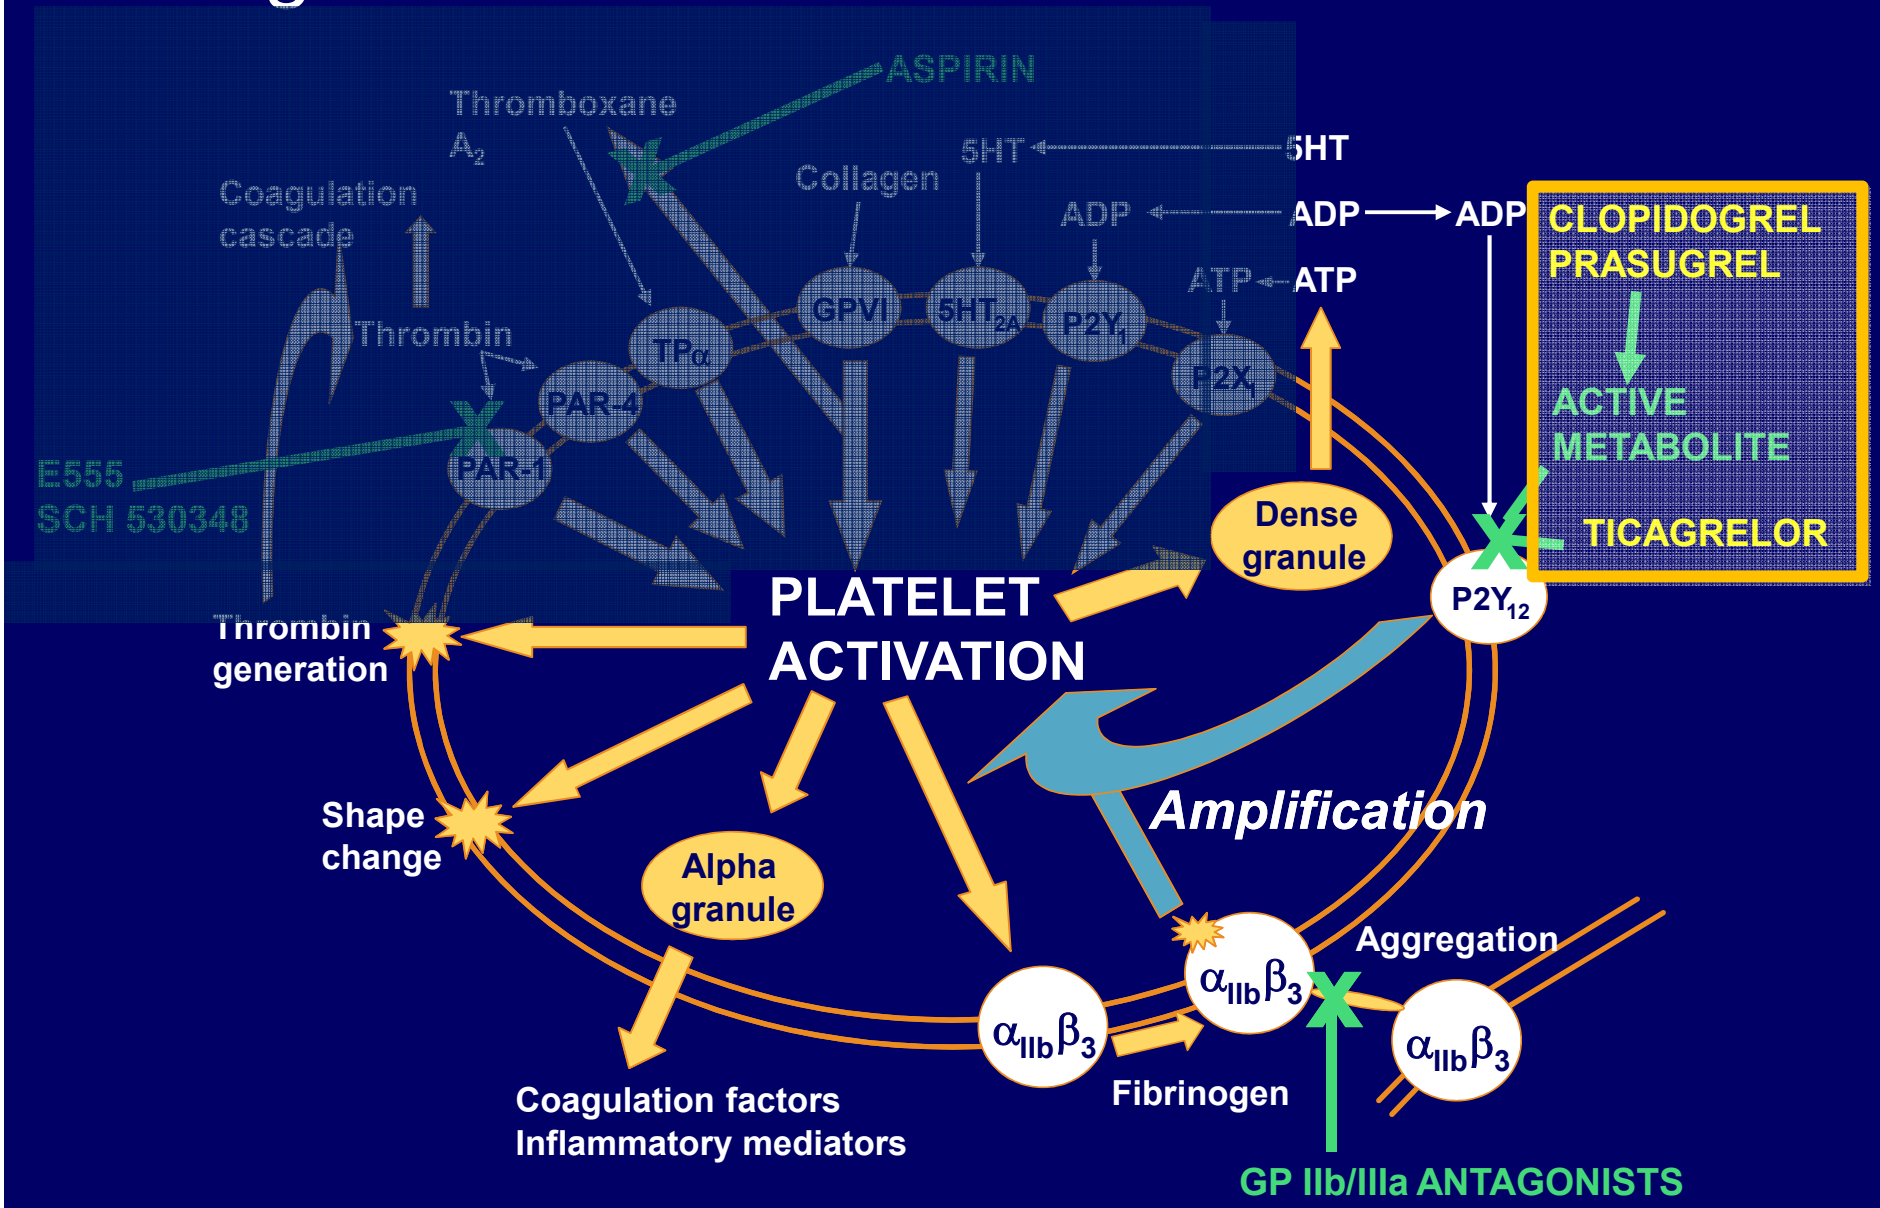




Is this the end of the case?



Targets for Platelet Inhibition



GP = glycoprotein; PAR = protease-activated receptor; TP = thromboxane A_2 / prostaglandin H_2.
Adapted from Storey RF. *Curr Pharm Des*. 2006;12:1255-1259.

- Which other therapies need we consider ?
- Why ?

- Statins
- Diabetes
- B Blockers
- Others

STATINS

Cardioprotective Effect Of **The Statins**.

pleiotropic effects

- Modify –
  inflammation, endothelial function, plaque stability, and thrombus formation

Rosenson RS, Tangney CC.. JAMA 1998; 279:1643–50.
Dangas G Thromb Haemost 2000;83:688 –92.
Davignon J. Circulation 2004;109 23 Suppl 1:III39–43.

- Both the anti-inflammatory and the endothelial effects may occur immediately after a single dose of statin.

Ostadal P Mol Cell Biochem 2003;246:45–50

- 24-h treatment with lovastatin and simvastatin induces inhibition of monocyte chemotactic protein-1 synthesis in mononuclear and endothelial cells in vitro

Romano M Lab Invest 2000;80:1095–100.

.

❑ Statins have beneficial effects on endothelial function by a rapid increase in nitric oxide bioavailability as early as 3 h after statin administration

Laufs U Circulation 1998;97:1129 –35.

❑ Nitric oxide shown act as physiological inhibitor of leukocyteendothelial cell interaction by suppressing up-regulation of several endothelial cell adhesion molecules, including P-selectin, vascular cell adhesion molecule-1, and intercellular adhesion molecule-1

Kubes P Proc Natl Acad Sci U S A 1991;88: 4651–5.

❑ Statins attenuated neutrophil-endothelium interaction in the coronary microvasculature

Lefer AM Circulation 1999;100:178–84.
Ueda J Am Coll Cardiol 1999;34:2120 –5.

❑ Brief (10-min) exposure of the normo-cholesterolemic adult heart to atorvastatin, after a period of injurious ischemia, recruits the phosphatidyl inositol 3-kinase pathway, leading to cardioprotection

Bell. J Am Coll Cardiol 2003;41:508 –15.

Table 3 Individual and Combined Outcome Measures of the Primary End Point at 30 Days in the Atorvastatin Reload and Placebo Groups

	Atorvastatin Reload (n = 192)	Placebo (n = 191)	p Value
Cardiac death	0	1 (0.5)	NS
Myocardial infarction	7 (3.7)	17 (8.9)	0.056
Stent thrombosis	0	1 (0.5)	NS
Target vessel revascularization	0	1 (0.5)	NS
Total MACE	7 (3.7)	18 (9.4)	0.037

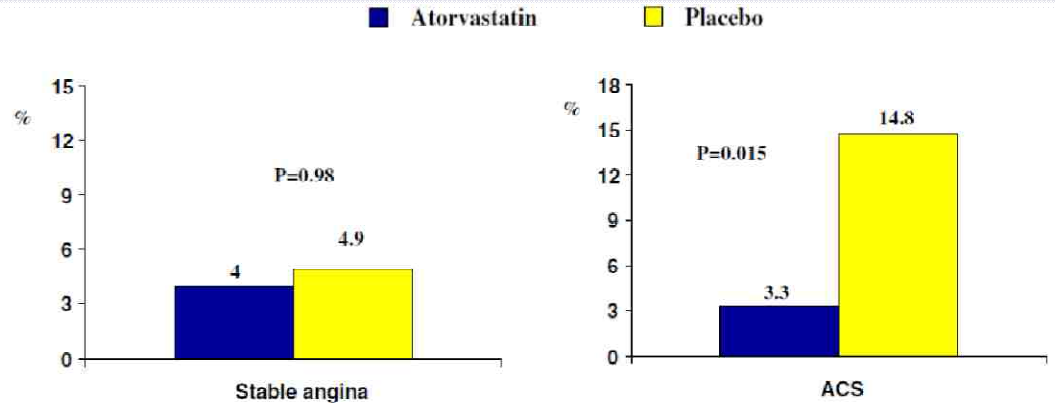

Figure 2 Secondary End Points

Conclusions The ARMYDA-RECAPTURE trial suggests that reloading with high-dose atorvastatin improves the clinical outcome of patients on chronic statin therapy undergoing PCI. These findings may support a strategy of routine reload with high-dose atorvastatin early before intervention even in the background of chronic therapy. (J Am Coll Cardiol 2009;54:558–65)

- Abstract
- The optimal glycosylated hemoglobin (HbA1C) target in diabetic patients is a subject of ongoing controversy that may be especially pertinent in diabetic patients with coronary artery disease. This study aimed to determine the prognostic value of preprocedural HbA1C levels in diabetic patients undergoing percutaneous coronary intervention (PCI) with stent implantation. From 2002 to 2007, a cohort of 952 consecutive diabetic patients underwent PCI with stent implantation in our center. We compared patients with a normal preprocedural HbA1C (< or = 7%, n = 429) with patients with an increased HbA1C (>7%, n = 523). One-year rate of major adverse cardiovascular events (MACEs) including death, myocardial infarction, and target vessel revascularization was indexed. Baseline characteristics were similar between groups, except for body mass index, which was higher in the high HbA1C group (32.2 vs 31.2 kg/m(2), p = 0.03). Patients in the high HbA1C group were more likely insulin dependent (45.5% vs 26.3%, p <0.001). Rates of MACEs were similar (23.7% vs 20.8%) in the high HbA1C and low HbA1C groups (p = 0.45). By multivariate analysis, age, renal failure, clinical presentation as myocardial infarction, and history of congestive heart failure were independently associated with MACEs. In contrast, HbA1C was not associated with patient outcome. In conclusion, this study suggests that HbA1C is not a predictor of cardiac events in diabetic patients with advanced coronary artery disease. These results could explain, at least in part, recent findings of randomized clinical trials that suggest the absence of benefit in macrovascular complications of a strict glycemia control.
