Two/Three Vessel CAD

(n= 87)

After stenting the target vessel
The non-target lesion underwent FFR

FFR \leq 0.8 \rightarrow IVUS, NIRS

Randomized

Standard

n = 43

Continue statin the patient was taking
Dual antiplatelet therapy for 1 year

Aggressive

n = 44

Rosuvastatin 40 mg daily
Dual antiplatelet therapy for 1 year

Follow up Cath (6-8 weeks)
FFR, IVUS and NIRS repeated.
If FFR \leq 0.8, lesion stented and imaging repeated.
If FFR > 0.8 the patient was treated medically.

Imaging data analyzed by CRF Core Lab
Data analysis for primary outcome analyzed by MSH independent Core Lab

Relationship between Lipid Regression and maxLCBI_{4mm}

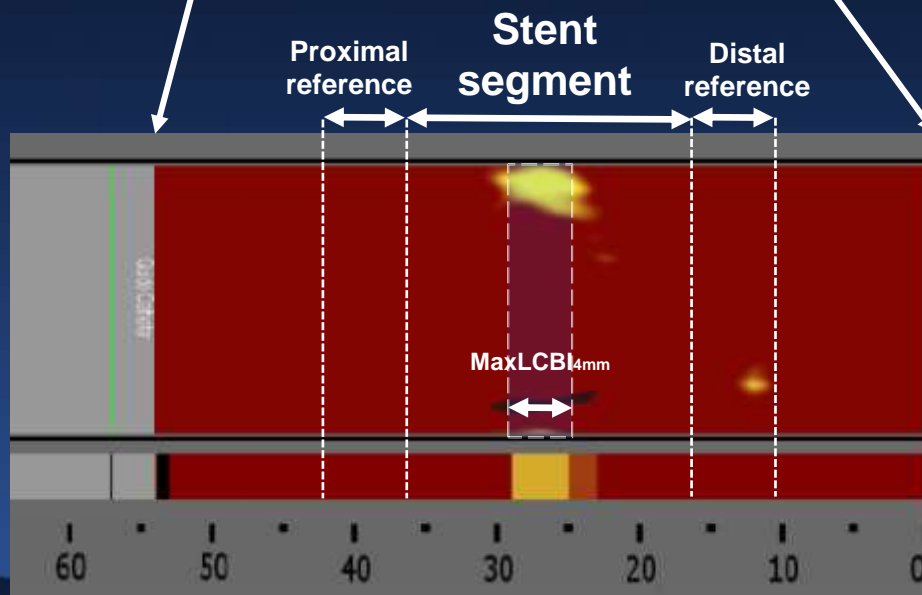

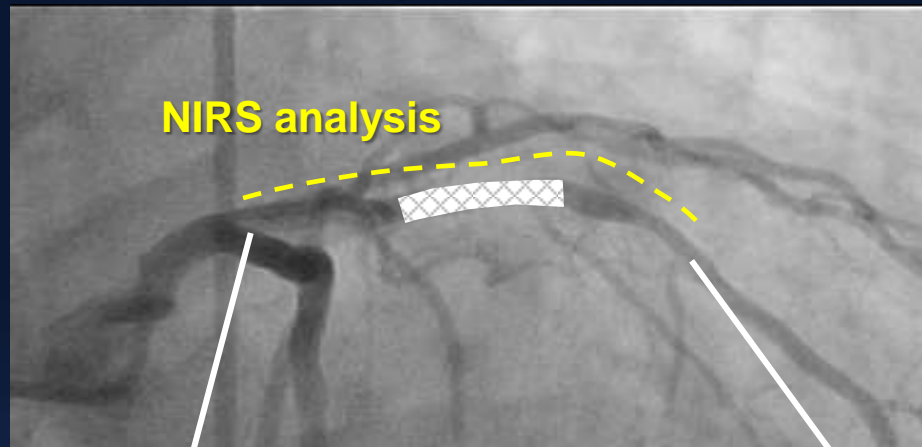

Dohi T et al. *Eur Heart J Imaging* 2014

Extent of lipid rich plaque by NIRS may predict DES restenosis

- ◆ From a total of 478 patients with complete data between February 2009 and November 2011, we identified 14 patients with stent failure.
- ◆ Of 14 patients with restenosis, ISR was found in 13 patients (9 focal, 3 diffuse, 1 total occlusion), and proximal edge restenosis was found in 1 patient.
- ◆ All implanted stents were DES, and the median follow-up time was 392 days (IQR: 300 to 418) after index PCI.
- ◆ Thirty case-matched controls were identified.

Co-registration of NIRS with Angiogram

Coronary angiography

NIRS chemogram

- The stent segment was defined as the length of vessel in which any stent implantation was performed.
- The corresponding stenting zone on the chemogram was identified by colocalized registration marks placed on the chemogram by the treating physician.

Clinical Characteristics and QCA Results

	Restenosis (N=14)	No-restenosis (N=30)	p value
Baseline characteristics			
Age, years	62±7	61±7	0.69
Male	93%	100%	0.32
Diabetes mellitus	50%	53%	0.84
Acute coronary syndrome	43%	47%	0.81
Final QCA results at index procedure			
Total stent length, mm	30 (14, 51)	25 (17, 49)	0.95
Minimal lumen diameter, mm	2.0 (1.9, 2.2)	2.2 (2.0, 2.5)	0.13
Reference vessel diameter, mm	2.5 (2.2, 3.1)	2.8 (2.6, 3.2)	0.26
Percent diameter stenosis, %	19.7 (12.8, 29.3)	16.3 (11.3, 24.9)	0.70

Comparison of LCBI and maxLCBI_{4mm} in the Stented Segment Grouped by Occurrence of Restenosis

Lesion LCBI

MaxLCBI_{4mm}

NIRS findings with and without restenosis

	Restenosis (N=14)	No-restenosis (N=30)	p value
LCBI in the stented segment	126 (63, 210)	89 (24, 143)	0.092
MaxLCBI _{4mm}	416 (250, 854)	284 (158, 428)	0.043
LCBI in the proximal reference	31 (1, 105)	19 (0, 90)	0.65
LCBI in the distal reference	3 (0, 91)	0 (0, 8)	0.71
MaxLCBI _{4mm} <200	7%	37%	0.047
MaxLCBI _{4mm} <100	0%	0%	0.092

Data are expressed as median (interquartile range).

* MaxLCBI_{4mm} = maximum LCBI in any 4 mm-long segment

Accuracy evaluation using ROC curve analysis

- The best cut-off of maxLCBI_{4mm} for detecting stent failure was 525 (AUC=0.693) with a specificity of 85% and a sensitivity of 50%.
- A cut-off of 200 maxLCBI_{4mm} had a 93% sensitivity and 92% negative predictive value.

Summary

- 1. NIRS can detect the lipid rich plaque (LRP) in the coronary artery.**
- 2. There are associations between LRP and 1) clinical presentation, 2) statin usage, 3) peri-procedural MI, and 4) in-stent restenosis.**
- 3. No existence of LRP ($\text{maxLCBI}_{4\text{mm}} < 200$) shows high negative predictive value for absence of in-stent restenosis (92%).**
