## Biodegradable polymer BES (Nobori, n=1617) vs. Durable polymer EES (Xience, n=1618)

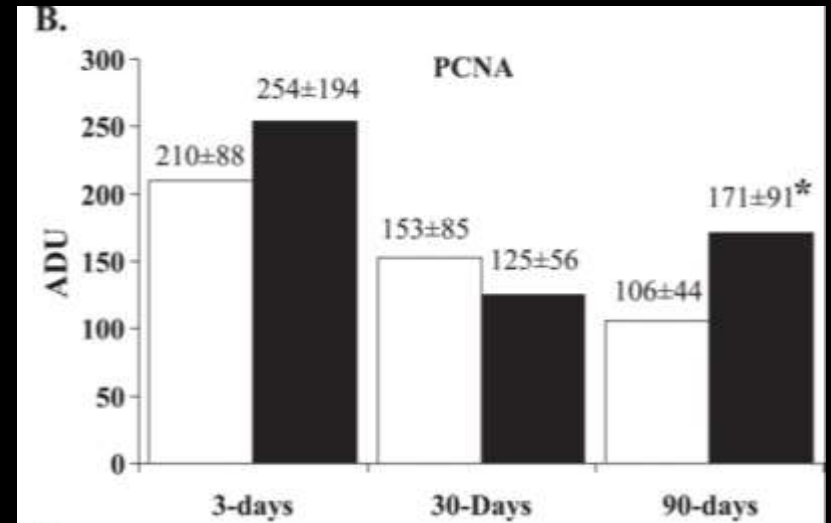

**Why Contemporary Durable  
Polymers Are Not Good Enough.**

# Permanent Polymers, Inflammation and Late Catch Up

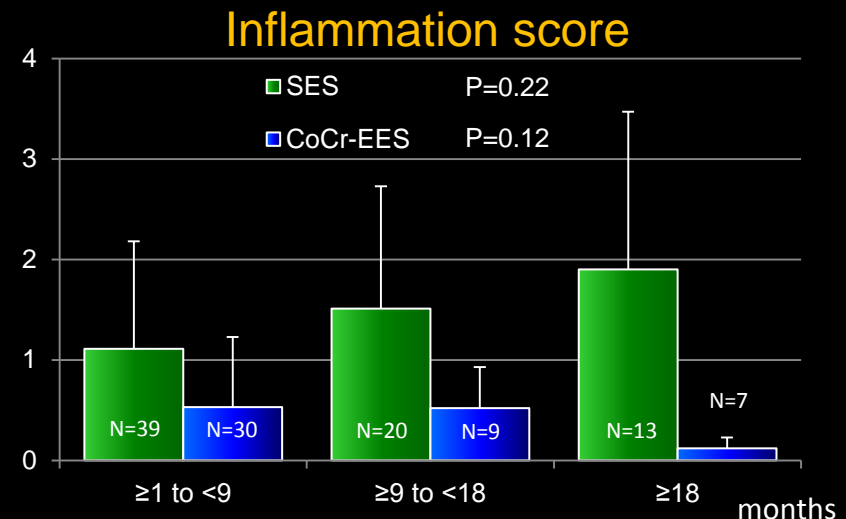

Increasing inflammation →

Carter AJ. Cardiovascular Research. 2004

# Vascular Response following Implantation of Drug-eluting stents in Human

A 58-year-old man who had received 2 SES (for 3 years) and 1 CoCr-EES (for 7 months) died suddenly 1 day after nasal polyp surgery. DAPT was discontinued 5 days before the surgery.

# Inflammation in the 2<sup>nd</sup>-generation DES

61M, E-ZES (3 months)

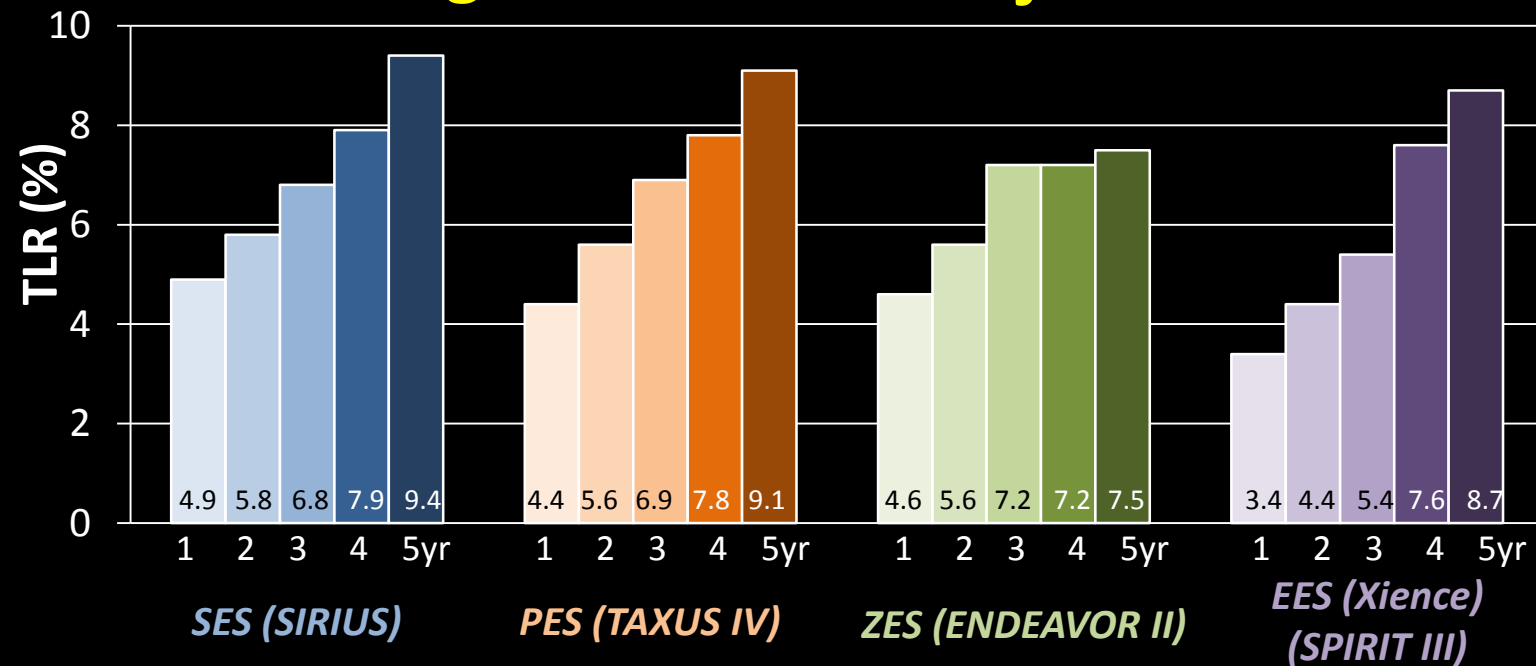

51M, CoCr-EES 4 months

Chronic inflammation consisting with giant cells secondary to polymer delamination in ZES

*Otsuka F, et al. Circulation. 2014;129:211-223.*

# Long-term TLR in major clinical trials

# Change in maximum neointimal thickness in human DES autopsy

# First-generation DES with localized Hypersensitivity and Malapposition

Patient #	Age (yrs)/ Sex	Lesion	Stent Type	Total Stented Segment (mm)	Duration of Implants (Months)	Indication for Implants	Clinical Presentation	Malapposition	Malapposed Distance ( $\mu\text{m}$ )
SES with localized hypersensitivity reaction									
1	61/M	RCA	SES	18	4	SAP	Sudden death	No	—
2*	40/F	LAD	SES	27	17	AMI	Sudden death	Yes	650
		RCA	SES	25	17	AMI		Yes	320
3	49/M	LCX	SES $\times$ 2	27	18	UAP	AMI	Yes	1,620
4	46/M	LAD	SES	23	31	SAP	AMI	Yes	930
		RCA	SES $\times$ 2	30	31	AMI		Yes	1,200
5	62/F	LAD	SES $\times$ 3	41	36	SAP	Repeat occlusion	NA†	—

LAD: SES (17months)

RCA: SES (17months)

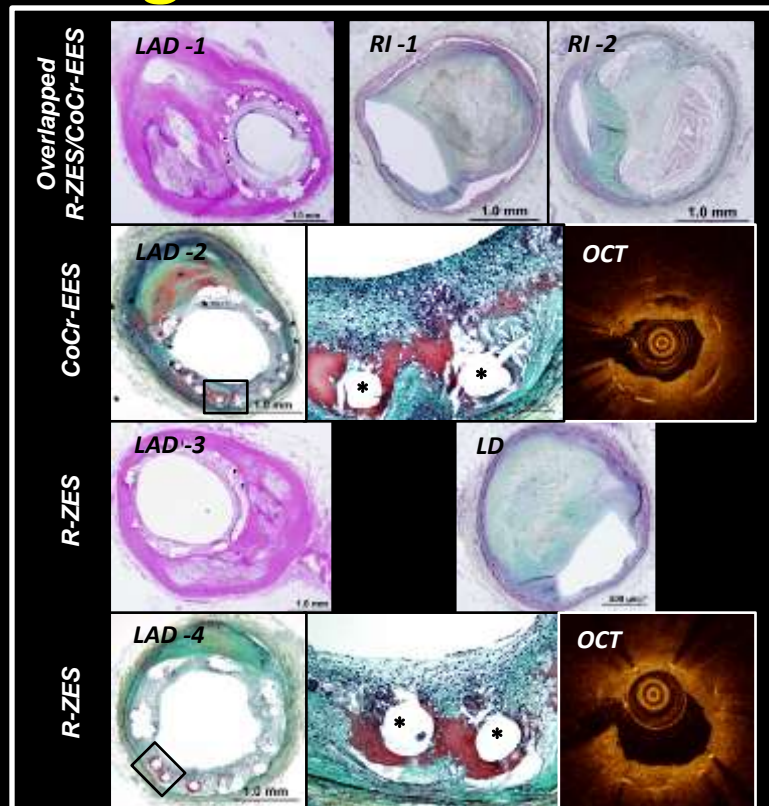

# Hypersensitivity Reaction in 2<sup>nd</sup> generation DES

A 55-year old male who presented with unstable angina secondary to diffuse disease in the LAD; four stents were implanted (3 Resolute zotarolimus-eluting stents (R-ZES) and a single cobalt-chromium everolimus-eluting stent (CoCr-EES)). At 238-days following implantation of the 4 stents the patient died suddenly.

**Coronary angiograph**

**Radiograph**

# Problems Encountered with Drug-Eluting Stents

## 1st-generation DES

- Thick struts
- Uneven polymer distribution with poor integrity, and thick coating of durable polymers
- High drug dose

- ✓ Uncovered struts
- ✓ Hypersensitivity
- ✓ Malapposition from fibrin deposition
- ✓ Stent fracture
- ✓ Neointimal hyperplasia

## Late Stent Thrombosis / Restenosis

Late catch-up

Uncovered struts

Hypersensitivity reaction

Malapposition from excessive fibrin deposition

Neointimal hyperplasia

## 2nd-generation DES

- Thinner struts
- More biocompatible polymer (Durable)
- Reduced drug dose

- ✓ Uncovered struts
- ✓ Hypersensitivity
- ✓ Malapposition from fibrin deposition
- ✓ Stent fracture
- ✓ Neointimal hyperplasia

## Clinical Late Catch-up

## Target Lesion Failure Clinical Outcome @ 9 months

9 months = 284 days

TLF = composite of cardiac death, target vessel MI and clinically driven TLR

# Conclusions

- Permanent polymers are associated with chronic inflammation and late catch up
- Preclinical rabbit studies show significantly less uncovered struts at 28-days and less fibrin at 90- days in Ultimaster than Xience by light microscopy.
- By confocal and SEM the endothelial coverage in rabbit iliac arteries was greater with higher maturation (i.e. more VE cadherin expression) in Ultimater than Xience.
- Not all polymers are created equal. The quantity and quality and the rate of degradation of the biodegradable polymers determines the extent of inflammation, which regulates neointimal thickening.
- Clinical studies suggest either non-inferior or superiority of bioabsorbable polymer as compared to durable polymer stents
