Thrombi

PB: 71.3%

FI : 41.4%

FF: 20.0%

NC: 23.0%

DC: 15.6%

Vulnerable Plaque !

To Treat Based on Fractional Flow Reserve, Not To Treat Based on FFR > 0.80

Vulnerable Plaque

**Negative FFR
0.89**

**Normal
Thallium Spect**

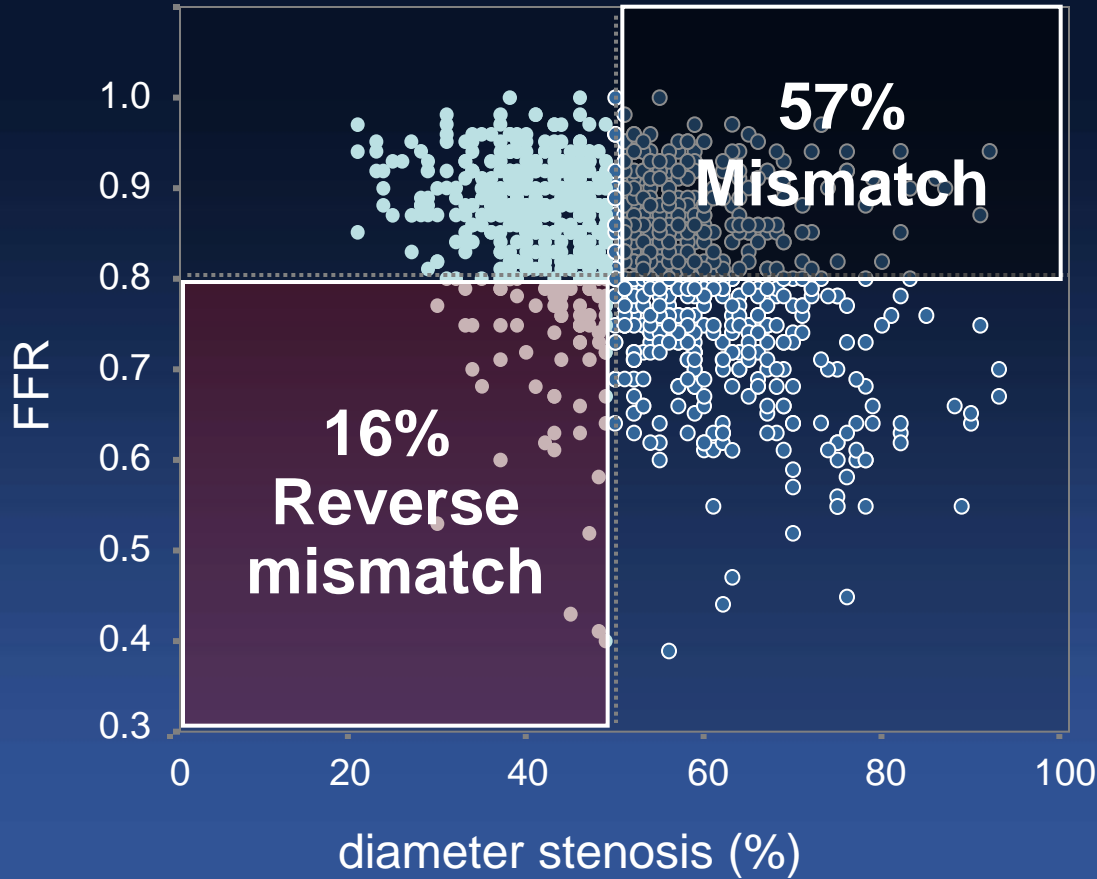

Why I Defer ?

1. I am a FFR believer.
2. FFR is *well matched with non-invasive stress tests.*
3. Negative non-invasive stress tests means *just excellent prognosis (0.6%/year, Cardiac Death and MI)*, even in the presence of angiographically proven coronary artery disease.

Shaw LJ, J Nucl Cardiol 2004;11:171-85 ,
Prognostic value of gated myocardial perfusion SPECT.
Very large meta-analysis. (n=39,173 patients)

Many Mismatches

(1066 Non-LM lesions, AMC data)

Tighter stenosis,
Negative FFR

Insignificant
stenosis,
Positive FFR

FFR Guided (>0.80) Defer,
Visually Significant Stenosis
(with/without Vulnerable Features)

< 1% of Death and MI / Year

Multicenter, Prospective Registry to Evaluate
The Natural History of FFR-Guided Deferred Coronary Lesions

IRIS FFR **DEFER** Registry

Patients with ≥ 1 Deferred Target Lesions
(DS $>50\%$ by visual estimation and FFR >0.80)

Deferred Patients
(N=10,000)

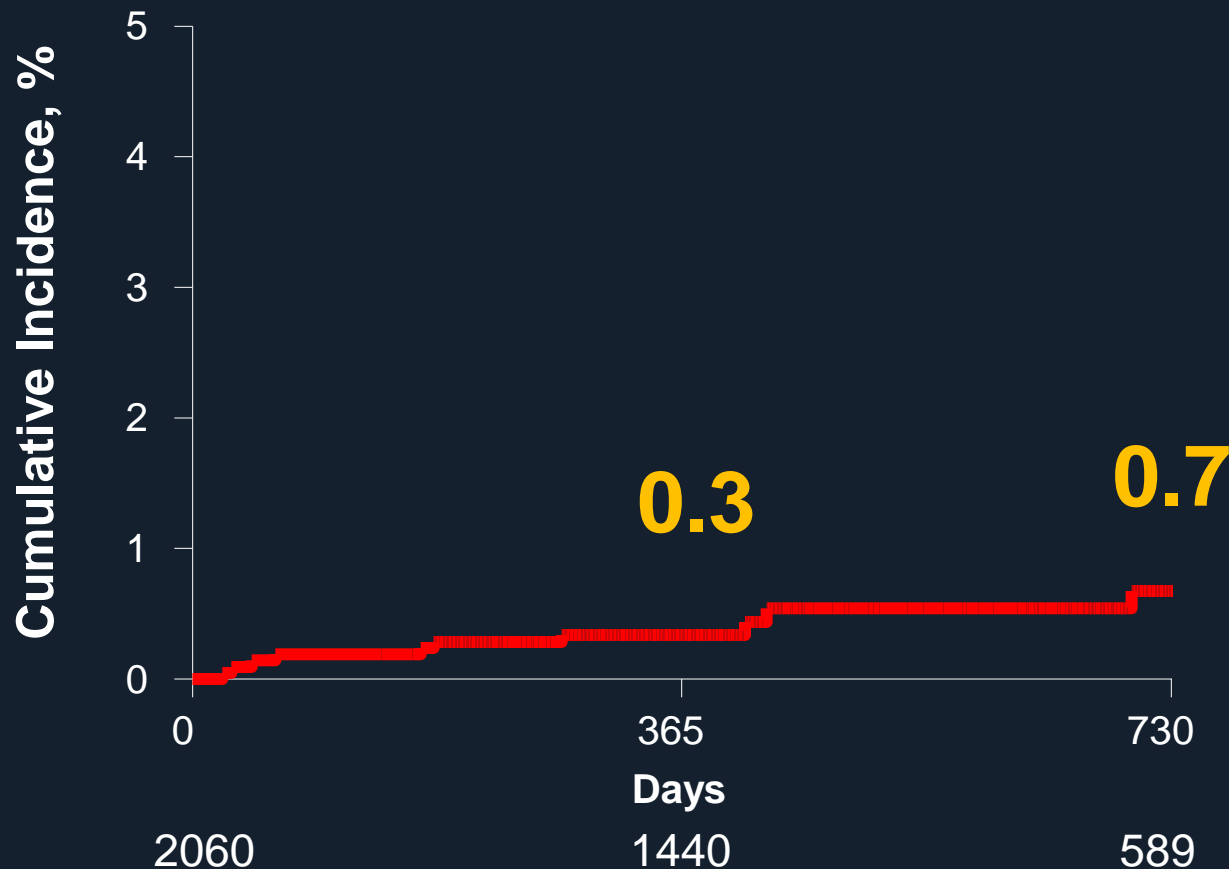

Imaging
Sub-Study
(n=1,200)

2 year
Clinical F/U

2-year CAG & Imaging FU
IVUS
VH-IVUS
OCT

Primary Endpoint : **Target Vessel Related (TVF)**
Cardiac Death, MI, and Clinical driven TVR at 2 year

Death and MI at 2 Year (per patient, n=2,060)

Death / MI

Revascularization at 2 Year

(per patient, n=2,060)

FFR Guided Defer Is *Safe and Good !*

Q1,
Should We Treat
Functionally Insignificant
Vulnerable Plaque ?

PROSPECT: MACE

(N=700, ACS, 3-Vessel Imaging after PCI)

Number at risk

	0	1	2	3
ALL	697	557	506	480
CL related	697	590	543	518
NCL related	697	595	553	521
Indeterminate	697	634	604	583

Independent Predictors of Non-Culprit Lesion Level Events

<u>Variable</u>	<u>HR [95% CI]</u>	<u>P value</u>
$PB_{MLA} \geq 70\%$	5.03 [2.51, 10.11]	<0.0001
VH-TCFA	3.35 [1.77, 6.36]	0.0002
$MLA \leq 4.0 \text{ mm}^2$	3.21 [1.61, 6.42]	0.001

by Cox Proportional Hazards regression

PROSPECT: Correlates of Non Culprit Lesion Related Events

Prevalence* 51.2% 49.1% 30.7% 17.4% 15.4% 11.0% 4.6%

Lesion HR 3.8 (2.2, 6.6) 5.0 (2.9, 8.7) 7.9 (4.6, 13.8) 6.4 (3.4, 12.2) 6.7 (3.4, 13.0) 10.8 (5.5, 21.0) 10.8 (4.3, 27.2)

P value <0.0001 <0.0001 <0.0001 <0.0001 <0.0001 <0.0001 <0.0001

*Likelihood of one or more such lesions being present per patient. PB = plaque burden at the MLA

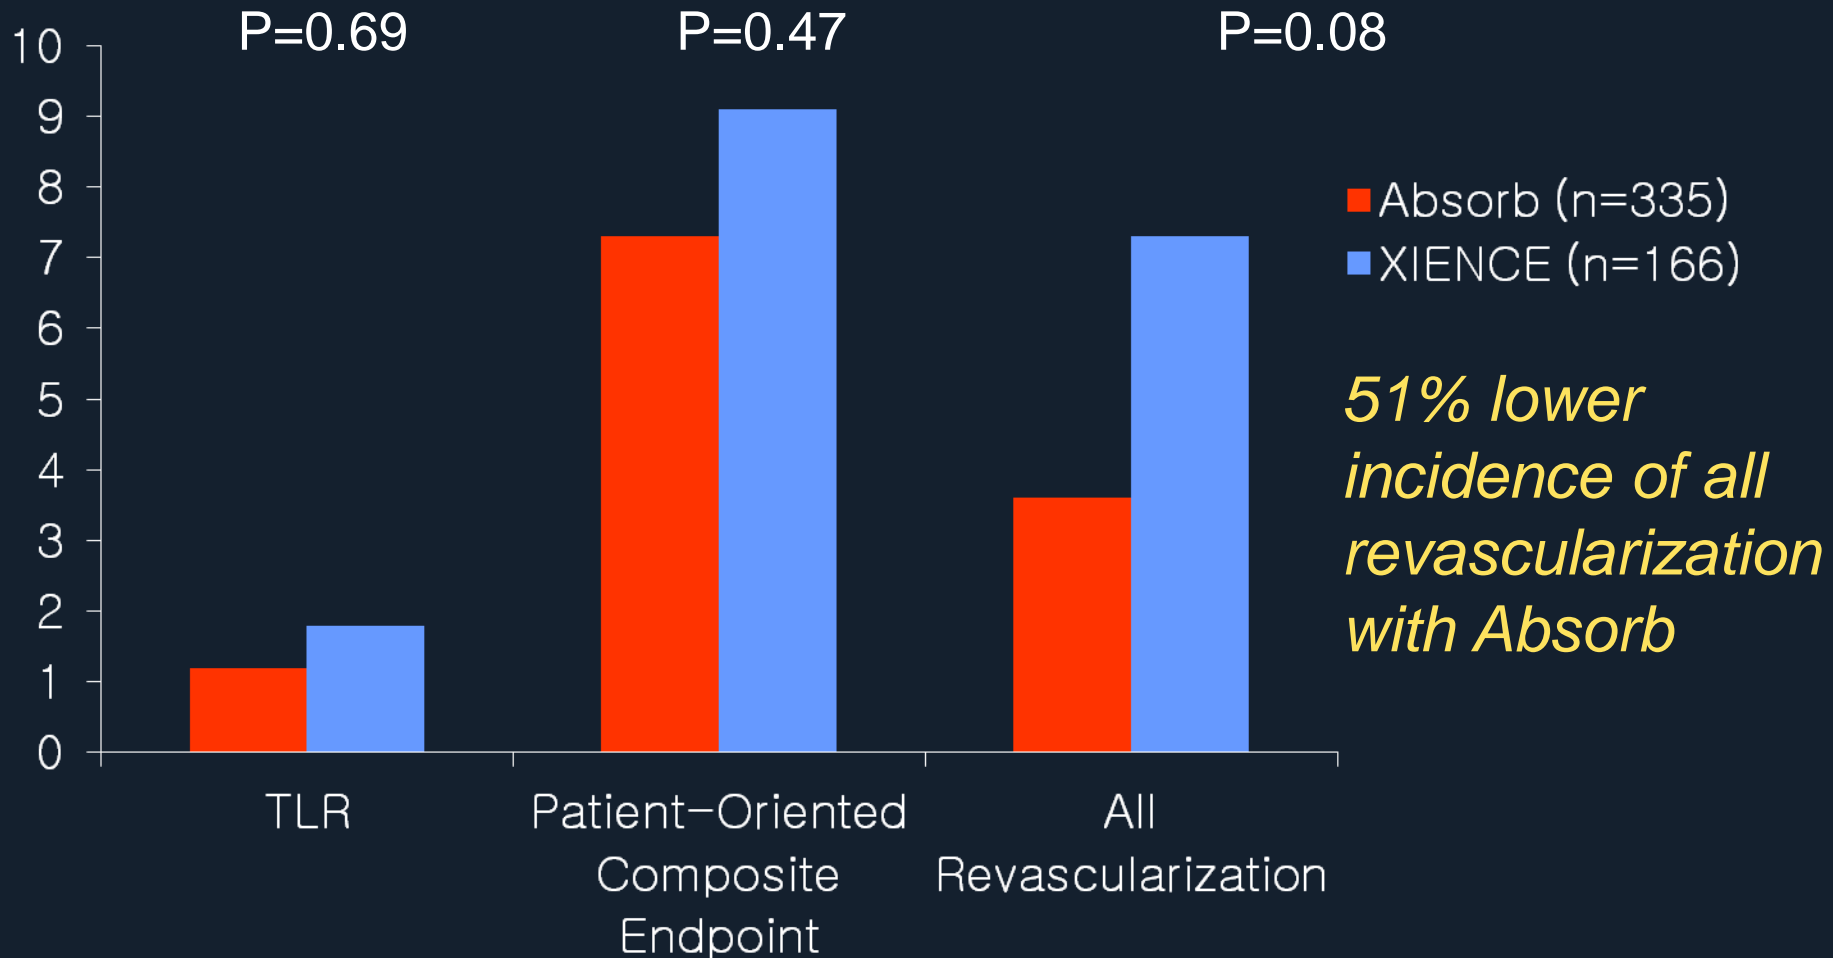

Q2,
***Can BVS Implantation
Stabilize Plaque Vulnerability ?***

Abbott Absorb, Balloon expandable, Bioresorbable Vascular Scaffolds (BVS)

*PLLA ; Poly (L-lactide), Everolimus eluting
Multi-link pattern, 150 um*

ABSORB II, 1-year Results

BVS Strut Was Replaced With Smooth Muscle Cells and Myofibroblasts

1 month

6 month

Natural Plaque Changes of Deferred Lesion

Natural Aging, Plaque Changes After 1 year of Statin Therapy

	Pre	1 year
Vessel area (mm ²)	13	12 (8%) ↓
Mean lumen area (mm ²)	3.9	3.6 (8%) ↓
Plaque area (mm ²)	8.6	8.2 (5%) ↓
Necrotic core (%)	22	18 (18%) ↓

Decreased

- Vessel area,
- Plaque area,
- MLA, and
- % Necrotic core.

BVS induced Lumen Enlargement due to Significant Plaque Regression

Natural Aging with Statin

Pre

1 year

	Pre	1 year
Vessel Area	13	12 (8%) ↓
MLA	3.9	3.6 (8%) ↓
Plaque Area	8.6	8.2 (5%) ↓

BVS Implantation

Pre-PCI

Post-PCI

6 months

2 years

5 years

Vessel area (mm²)	15.72	15.34 (3%) ↓	14.09 (10%) ↓	13.76 (12%) ↓
MLA (mm²)	6.95	6.17 (11%) ↓	6.56 (5.6%) ↓	8.09 (16%) ↑
Plaque area (mm²)	8.78	9.17 (4%) ↑	7.54 (14%) ↓↓	7.07 (19%) ↓↓

Hypothesis,

BVS Implantation Can Stabilize Plaque Vulnerability and Induce Plaque Regression, Which May Prevent Future Events of Deferred Lesions.

PREVENT Study,

The **PREVENT**ive Implantation of BVS
on Stenosis With Functionally Insignificant
Vulnerable Plaque.

Searching for Vulnerable Plaque, Functionally Insignificant (FFR >0.80)

1. TCFA
2. $PB_{MLA} \geq 70\%$
3. $MLA \leq 4.0 \text{ mm}^2$
4. LRP on NIRS ($_{\max}LCBI_{4\text{mm}} > 500$)

The **PREVENTive** Implantation of Bioresorbable Vascular Scaffold on Stenosis With Functionally Insignificant Vulnerable Plaque

PREVENT Trial

Any Epicardial Coronary Stenosis
with **FFR ≥ 0.80** and with **Two** of the following

1. IVUS MLA $\leq 4.0\text{mm}^2$
2. IVUS Plaque Burden $>70\%$
3. Lipid-Rich Plaque on NIRS ($_{\max}\text{LCBI}_{4\text{mm}} > 500$)

Primary endpoint *at 2 years*:
CV death, MI, Hospitalization d/t unstable angina

OCT sub-study/ NIRS sub-study, (300 patients in each arm at 2 years)

Objective,

To determine whether BVS implantation on functionally insignificant vulnerable plaque, reduce the incidence of the composite of MACEs compared with optimal medical therapy alone.

A prospective, randomized, multicenter, clinical trial with 'all comers' design. Approximately 2,000 patients will be enrolled from international heart centers.

Inclusion Criteria

Age 18 years or older,
Symptomatic or asymptomatic coronary stenosis,
Eligible for PCI, with
FFR >0.80 and met the two of the following

1. IVUS MLA $<4\text{mm}^2$
2. IVUS plaque burden $>70\%$
3. Lipid-rich plaque on NIRS ($_{\max}\text{LCBI}_{4\text{mm}} >500$)

Exclusion Criteria

Preferred treatment for CABG, STEMI, Bypass graft lesion, Contraindication to dual antiplatelet therapy
Life expectancy <2y, Planned cardiac surgery or planned major non cardiac surgery, Woman who are breastfeeding, pregnant or planning to become pregnant during the course of the study.

Primary and Major Secondary End Point,

The primary endpoint is the 2-year MACE (cardiovascular death, nonfatal MI, unplanned rehospitalization due to unstable angina).

The secondary endpoints include overall MACE, non-urgent revascularization, and rate of cerebrovascular event.

PREVENT Trial, *Will Be Started May, 2015*
