Aims To assess mortality after drug-eluting stent (DES) or bare-metal stent (BMS) for ST-segment elevation myocardial infarction (STEMI).

Methods and results In this multinational registry, 5093 STEMI patients received a stent: 1313 (26%) a DES and 3780 (74%) only BMS. Groups differed in baseline characteristics, type, or timing of percutaneous coronary intervention, with a higher baseline risk for patients receiving BMS. Two-year follow-up was available in 55 and 60% of the eligible BMS and DES patients, respectively. Unadjusted mortality was lower during hospitalization, similar for the first 6 months after discharge, and higher from 6 months to 2 years, for DES patients compared with that of BMS patients. Overall, unadjusted 2-year mortality was 5.3 vs. 3.9% for BMS vs. DES patients ($P = 0.04$). In propensity- and risk-adjusted survival analyses (Cox model), post-discharge mortality was not different up to 6 months ($P = 0.21$) or 1 year ($P = 0.34$). Late post-discharge mortality was higher in DES patients from 6 months to 2 years (HR 4.90, $P = 0.01$) or from 1 to 2 years (HR 7.06, $P = 0.02$). Similar results were observed when factoring in hospital mortality.

Conclusion The observation of increased late mortality with DES vs. BMS suggests that DES should probably be avoided in STEMI, until more long-term data become available.

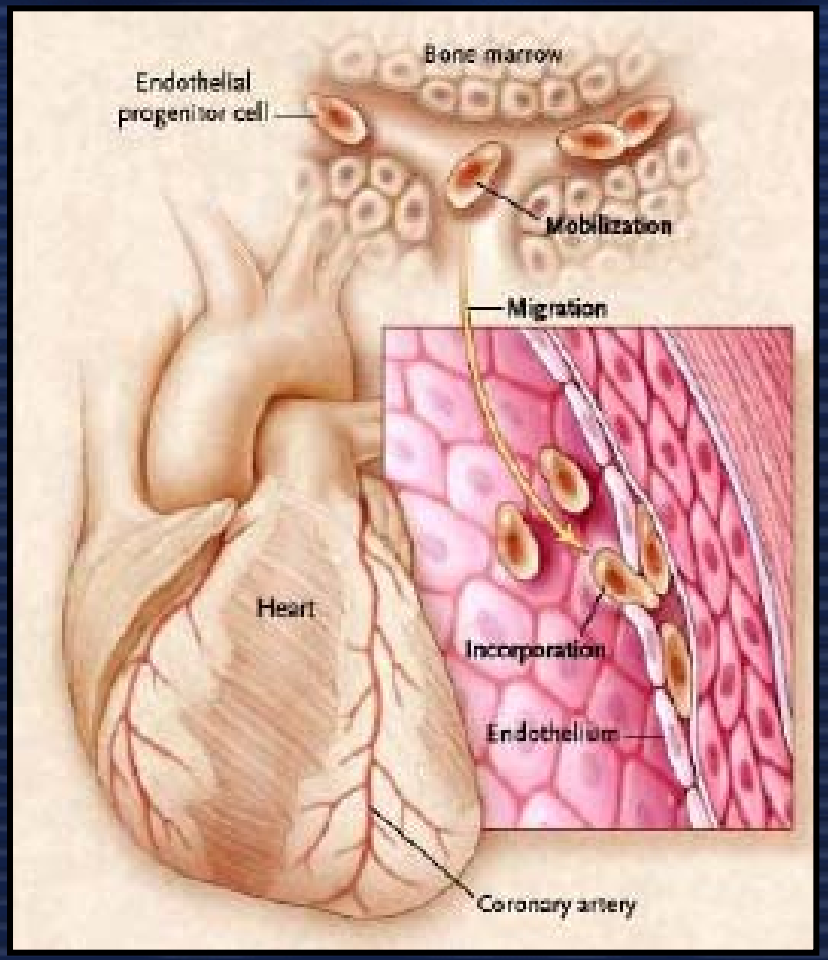
Endothelial progenitor cells (EPCs)

Cells in the general circulation that are genetically predisposed repopulate areas of vascular injury and endothelial disruption.
Their presence was first described by *Asahara et al* in 1996

EPCs physiology is rapidly emerging, critical importance in vascular disease, wound healing and vascular health

EPCs are bone marrow derived and circulate in the adult

They have the ability to differentiate into mature functional endothelial cells



(Rosenweig A et al. NEJM 2003;348:581-2)

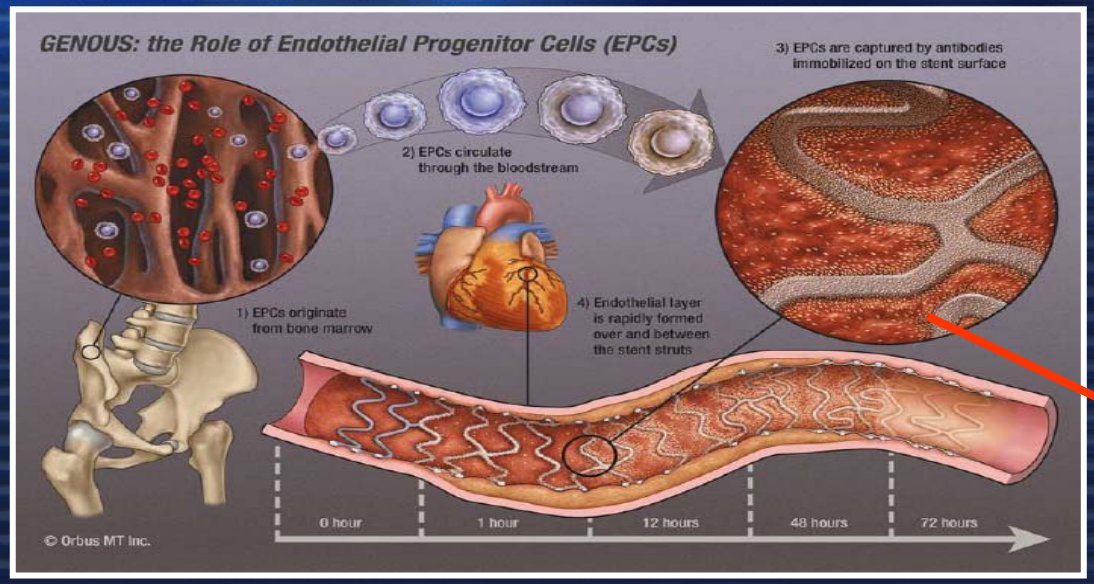
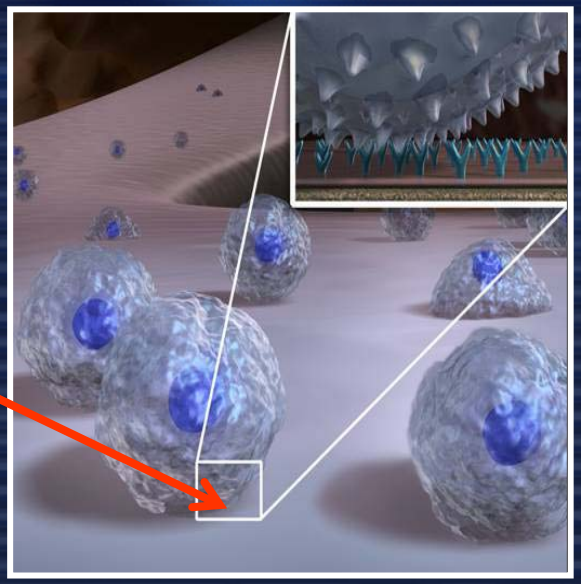
EPC Capture Coating Technology (GENOUS™ stent)





- Orbus has succesfully applied EPC capture technology to 316L stainless steel and NiTi stent
- Antibodies (murine monoclonal antihuman CD34) immobilizied on the stent surface are directed towards cell surface antigens on EPC
- By recruiting the body´s own EPCs to the site of vascular injury/stent, an acceleration of the normal endothelisation process would occur

➢ Purpose

The objective of this trial was to assess the feasibility and safety of the use of EPC capture stent for treatment of STEMI and comparison of 30-day and 6-month outcome with chromium-cobalt stents.

The use of EPC stent may result in more rapid healing process and improve clinical outcome.

➢ Method

Between August and December 2007, 100 consecutive patients with STEMI were randomly assigned (sealed envelope) to receive either EPC capture stent (N=50) (Genous™ stent) or chromium-cobalt stent (either Driver™ or Coroflex Blue™) (N=50).

Dual antiplatelet treatment was administered for 30 days in both groups.

A 6-month clinical, angiographic and IVUS follow-ups were assessed in both groups.

➢ Definitions

Deaths - cardiac or noncardiac
- undetermined causes reported as cardiac

Myocardial infarction

Q wave MI: new, pathological Q waves in≥2 contiguous leads with post-PCI increase
CK double the upper limit of normal and CK-MB>10% of CK level

Non-Q-wave MI: elevation of CK level to double the upper limit of normal, CK-MB>10% of CK level and no Q-waves

TLR – reinterventions inside the stent or within 5mm proximal or distal to the stent

Stent thrombosis (according to the Academic Research Consorcium)

- early (0-30 days) - late (31-360days) - very late (>361 days)

- definite: ACS+angiographic or autopsy evidence of thrombus or occlusion
- probable: unexplained deaths within 30 days of the procedure or acute MI involving the target-vessel teritory without angiography
- possible: all unexplained deaths>30 days after the procedure

➢ Statistical analysis (NCSS&PASS)

Continuous variables are expressed as the mean ±SD

Categorical variables as percentages

Continuous variables were compared by means of the Student´s *t- t.*

Categorical variables were compared by the means of the X^2 t.

A two-tailed value of $p<0.05$ was considered to be statistically significant

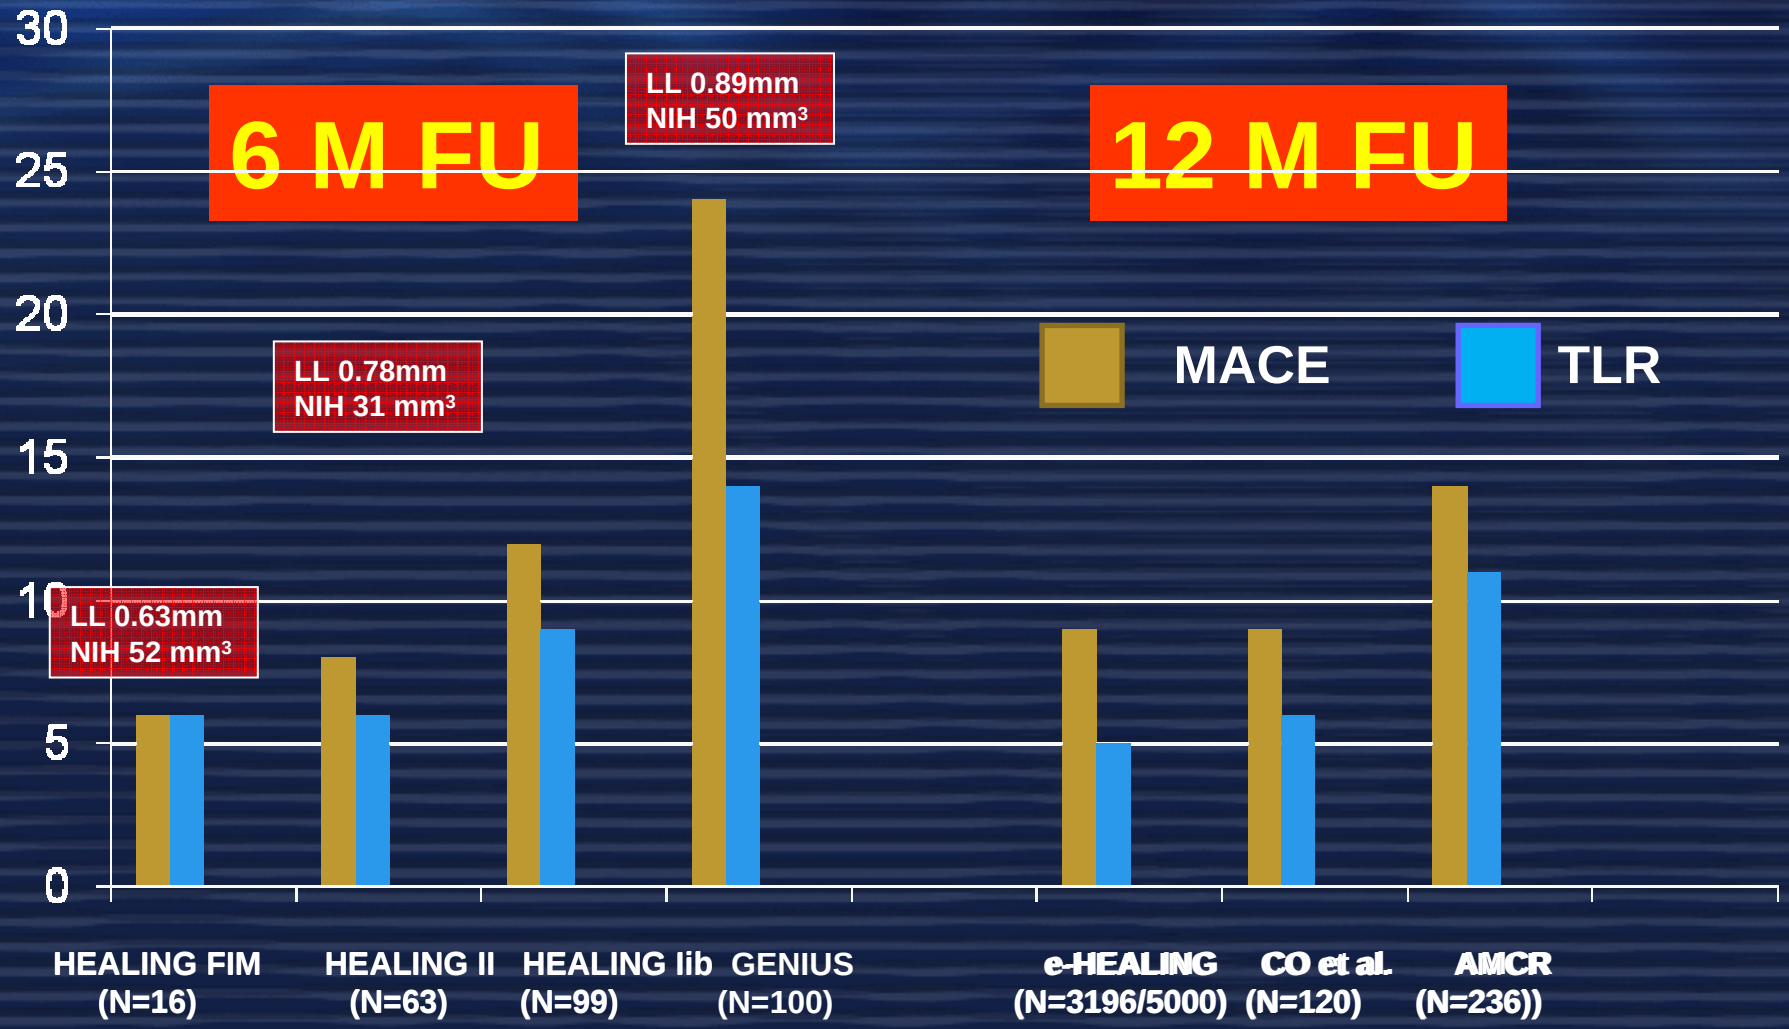
➢ Studies with EPCs capture stent



GENIUS-STEMI

Krajská zdravotní, a.s.
- Masarykova nemocnice v Ústí nad Labem, o.z.

➢ Conclusions:

The use of EPC capture stents in the setting of STEMI is feasible and save.

Caveats:

Small single-center trial

However, the rate of MACE at 6-month FU was significantly higher in Genous™ group when compare to CrCo stents.

No core lab

Warrisome is the rate of late stent thrombosis in EPCs capture stent group

Larger randomized trials are mandatory.
