

Asymptomatic Carotid Stenosis

Who Is The High Stroke Risk?

Jae-Hwan Lee, MD, PhD

Cardiovascular Center in
Chungnam National University Hospital

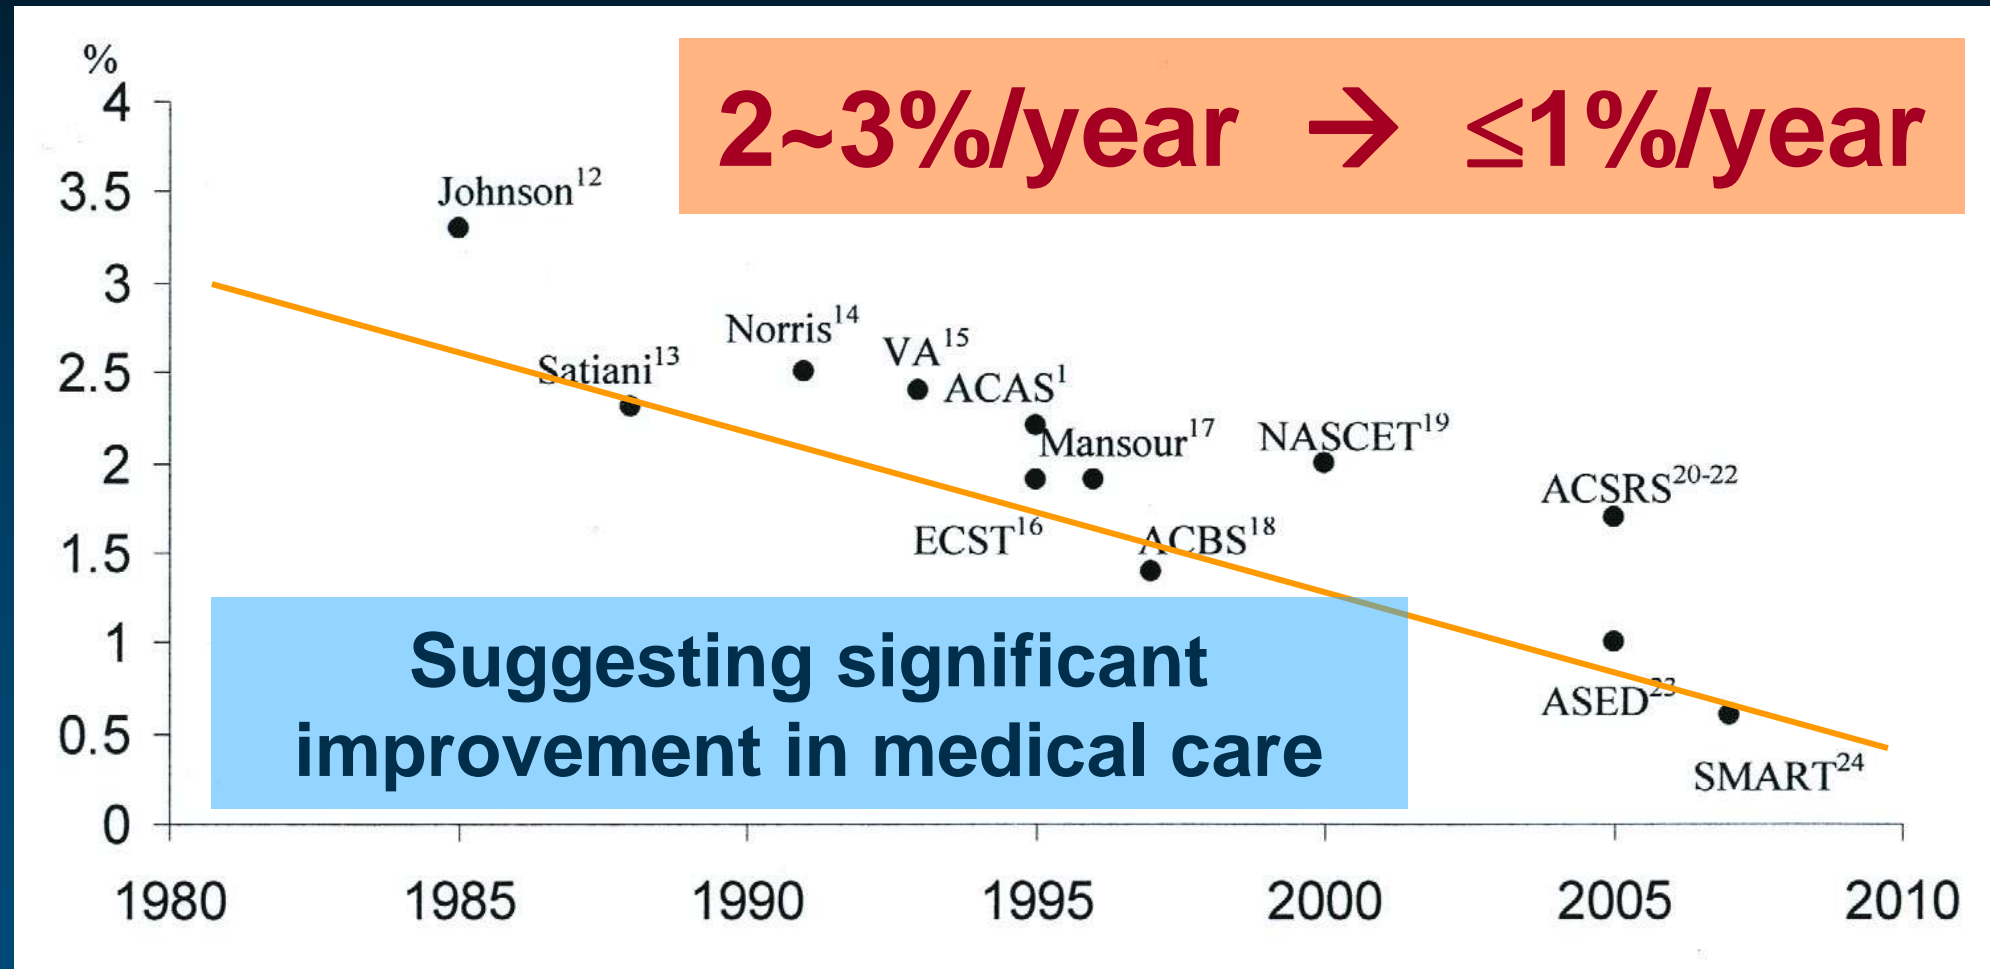

Carotid Stenosis & Stroke

- Depends on mainly
 - The degree of stenosis
 - Symptomatic or Asymptomatic
- Asymptomatic >60% carotid stenosis
 - 5% / 2 years
- Symptomatic >70% carotid stenosis
 - 26% / 2 years

Data before 2003

Asymptomatic Carotid Stenosis

Annual Risk of Ipsilateral and Any Stroke

- **Medical management has improved**
 - **Annual stroke risk < 1.0%/yr**
- **CAS & CEA have also improved**
 - **Procedure-related complication**
 - <3% for symptomatic**
 - <6% for asymptomatic**

Asymptomatic Carotid Stenosis

- In my opinion, most asymptomatic patients with carotid stenosis are best treated medically,
NOT BY CEA or CAS
- However, in the real world...
most (80-90%) of CEA & CAS patients are ASx
92% CAS/CEA are asymptomatic in 2005 US, McPhee JT, JVS2008;48:142
- CREST II will give the answer...
But, results years away

One Question for Surgeon and Interventionalist

Have you given the patient your best shot?

- We have to more aggressive for doing OMT -

Pharmacologic treatment

- Antiplatelet Therapy
- Antihypertensive Therapy
- Lipid Lowering Therapy
- Aggressive Glycemic Control

Lifestyle modification

- Smoking cessation
- Exercise program
- Nutrition counseling
- Rehabilitation

**However, some patients with asymptomatic
carotid stenosis will have a stroke!!!**

Can We Pick Them Up In Advance?

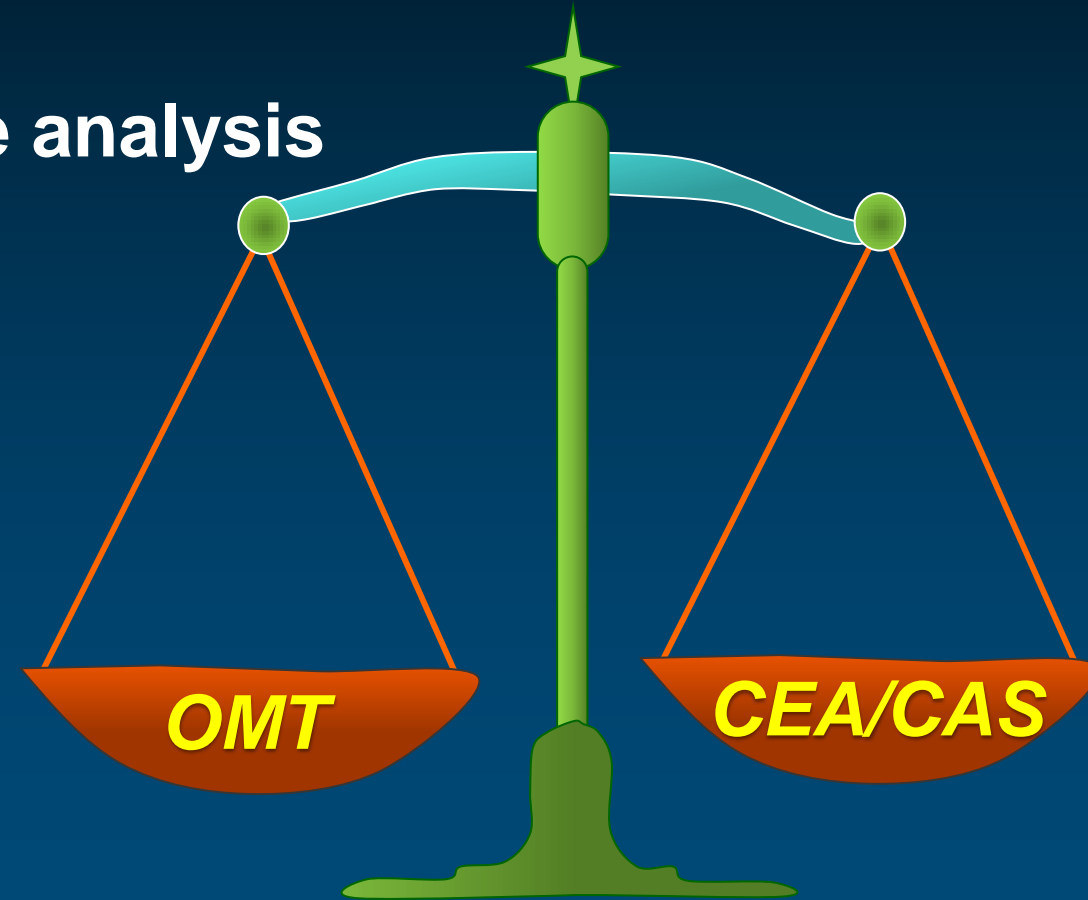

Stroke Prediction

In Patients With Asymptomatic Carotid Stenosis

**Who is at the
Greatest Risk?**

Risk Stratification

- Clinical features – CEA/CAS risk, Life expectancy
- Stenosis severity
- Stenosis progression
- Plaque area & computerized plaque analysis
- Plaque echolucency
- Plaque hemorrhage
- Plaque micro-ulcers
- Spontaneous embolization on TCD
- ‘Silent’ ipsilateral infarction on CT
- Contralateral carotid occlusion
- Impaired cerebral vascular reserve

Evaluation for
Carotid Stenosis

Current options for imaging

- Doppler ultrasound
- Trans-cranial Doppler
- Computed tomography angiography (CTA)
- Magnetic resonance angiography (MRA)
- Digital subtraction angiography

MR angiogram

Target lesion evaluation

Proximal vessel evaluation

Aortic arch evaluation
→ skip aortogram

Duplex Ultrasonography Quantitative Analysis

%DS

NASCET
 $= (D-N)/D \times 100$

ECST
 $= (E-N)/E \times 100$

NASCET 50%DS
 \cong ECST 70%DS
 \cong 90% AS

NASCET 70%DS
 $=$ ECST 85%ES

Degree of stenosis
 by area stenosis
 by Doppler velocity

Criteria for	50-69%	vs.	$\geq 70\%$ DS
PSV:	125-230		>230 cm/sec
EDV:	40-100		>100 cm/sec

Visually estimated $\cong 70\%$ ASx carotid stenosis
 \cong NASCET 50% \rightarrow not a candidate for CEA/CAS

Duplex Ultrasonography

Practice Guidelines and Diagnostic Criteria

Diameter stenosis (%)	PSV (cm/sec)	EDV (cm/sec)	ICA/CCA PSV ratio
Normal	<125	<40	<2.0
<50	<125	<40	<2.0
50–69	125–230	40–100	2.0–4.0
≥70	>230	>100	>4.0
Near total occlusion	Variable	Variable	Variable
Total occlusion	Undetectable	Undetectable	Not applicable

Which Parameters To Use?

- ***PSV and Plaque*** are primary parameters
 - PSV is single most accurate predictor of degree of stenosis
 - Plaque burden/area should be present with stenosis
- ***ICA/CCA ratio and EDV*** are helpful when;
 - Low or high flow states
 - Tandem lesions
 - Contralateral stenosis or occlusion

Duplex Ultrasonography

Qualitative Analysis

- Surface
 - smooth vs. irregular
 - ulcerated, intra-plaque hemorrhage
 - mobile atheroma
- Structure;
 - homogenous vs. heterogenous
 - echolucent, juxtaluminal black area
 - calcified

Duplex Ultrasonography

Homogenous vs. Heterogenous Plaque

Homogenous

Heterogenous

Duplex Ultrasonography

Heterogenous Plaque – Focal Anechoic Area

Hallmark of intra-plaque hemorrhage

Duplex Ultrasonography

Echolucent Plaque (Juxtaluminal Black Area, JBA)

Independent risk factor for ischemic event;

- *whether or not stenosis is hemodynamically significant***
- *more likely to result in emboli post CAS vs. post CEA***

Duplex Ultrasonography

Calcified Plaque with Mobile Atheroma

USG Prediction & ASx Carotid Stenosis

Predictors of Stroke

Number at risk	0	1	3	5	7
50-69	198	172	119	83	46
70-89	598	536	336	211	92
90-99	325	276	157	94	40

Number at risk	0	1	3	5	7
<40	518	470	302	192	86
40-79	489	416	256	162	80
80+	114	98	54	34	12

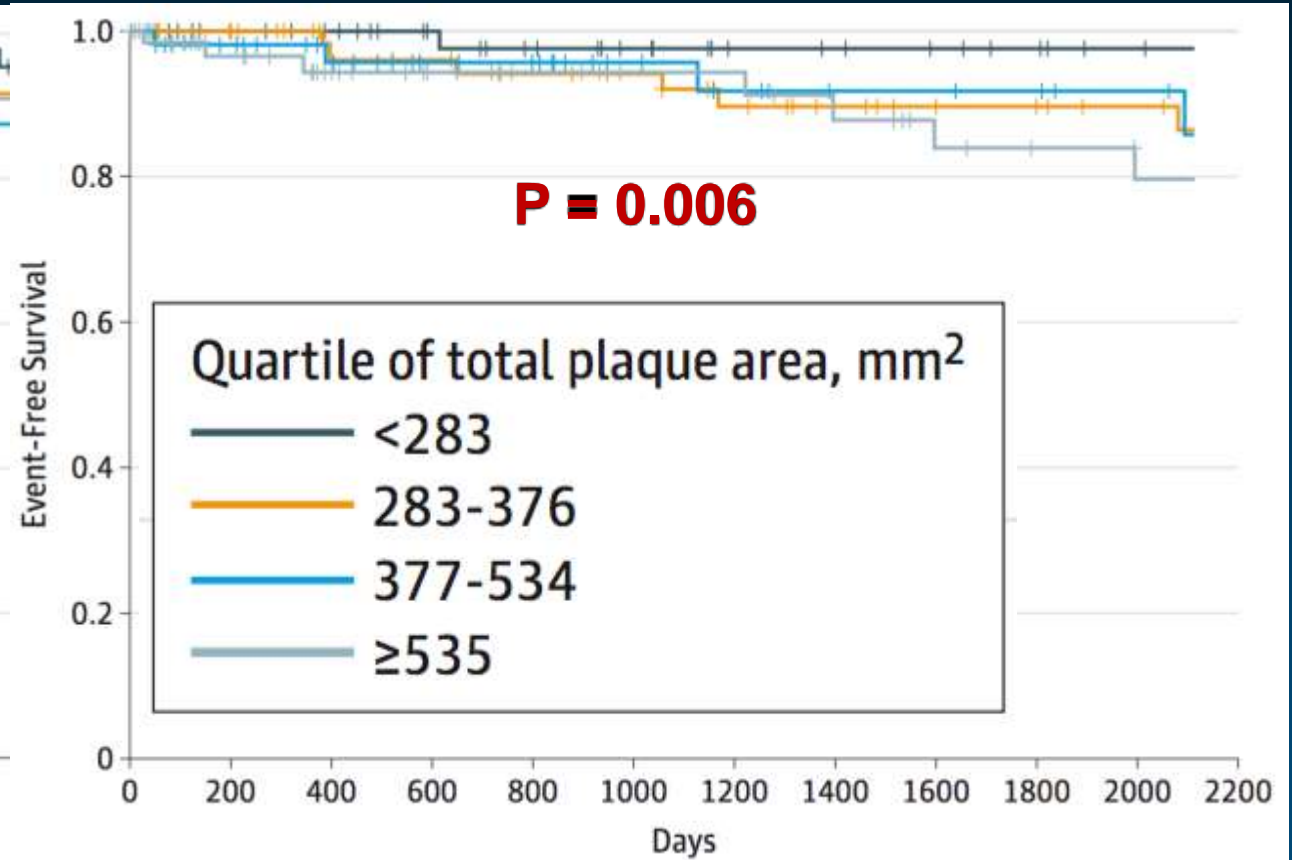

Asymptomatic Carotid Stenosis

Predictors of Stroke

Percent Stenosis

Plaque Burden

Echolucent Plaque & ASx Carotid Stenosis

Annual Risk of Ipsilateral Stroke

Plaque Type	Annual Stroke Risk
4	0.4%
3	0.8%
1 & 2	3.0%

Type 1; Uniformly echolucent (black)

Type 2; Mainly echolucent

Type 3; Mainly echogenic

Type 4 or 5; Uniformly echogenic

JBA & ASx Carotid Stenosis

Annual Risk of Ipsilateral Stroke

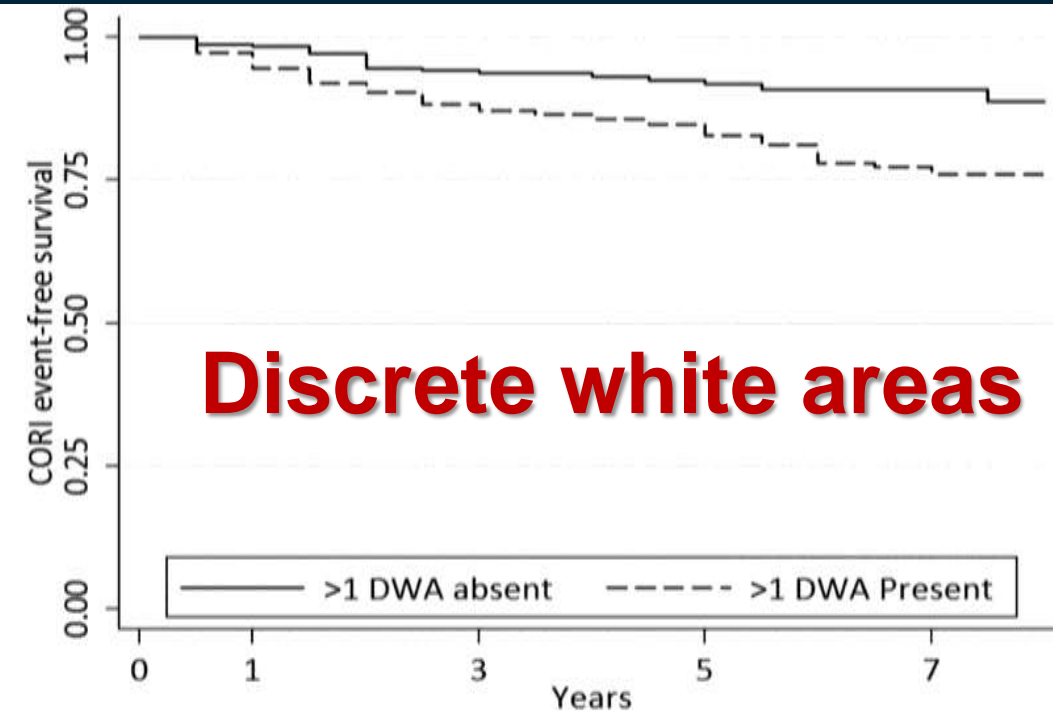

JBA (mm ²)	Annual Stroke Risk
<4	0.4%
4-8	1.4%
8-10	3.2%
>10	5.0%

USG Prediction & ASx Carotid Stenosis

Ehcolucent plaque

Number at risk	0	1	3	5	7
30+	609	531	343	219	96
15-29	269	244	138	86	39
<15	243	209	131	83	43

Number at risk	0	1	3	5	7
>1 DWA absent	403	346	208	127	58
>1 DWA Present	718	638	404	261	120

High Risk Predictors; Duplex USG

Heterogenic echogenicity

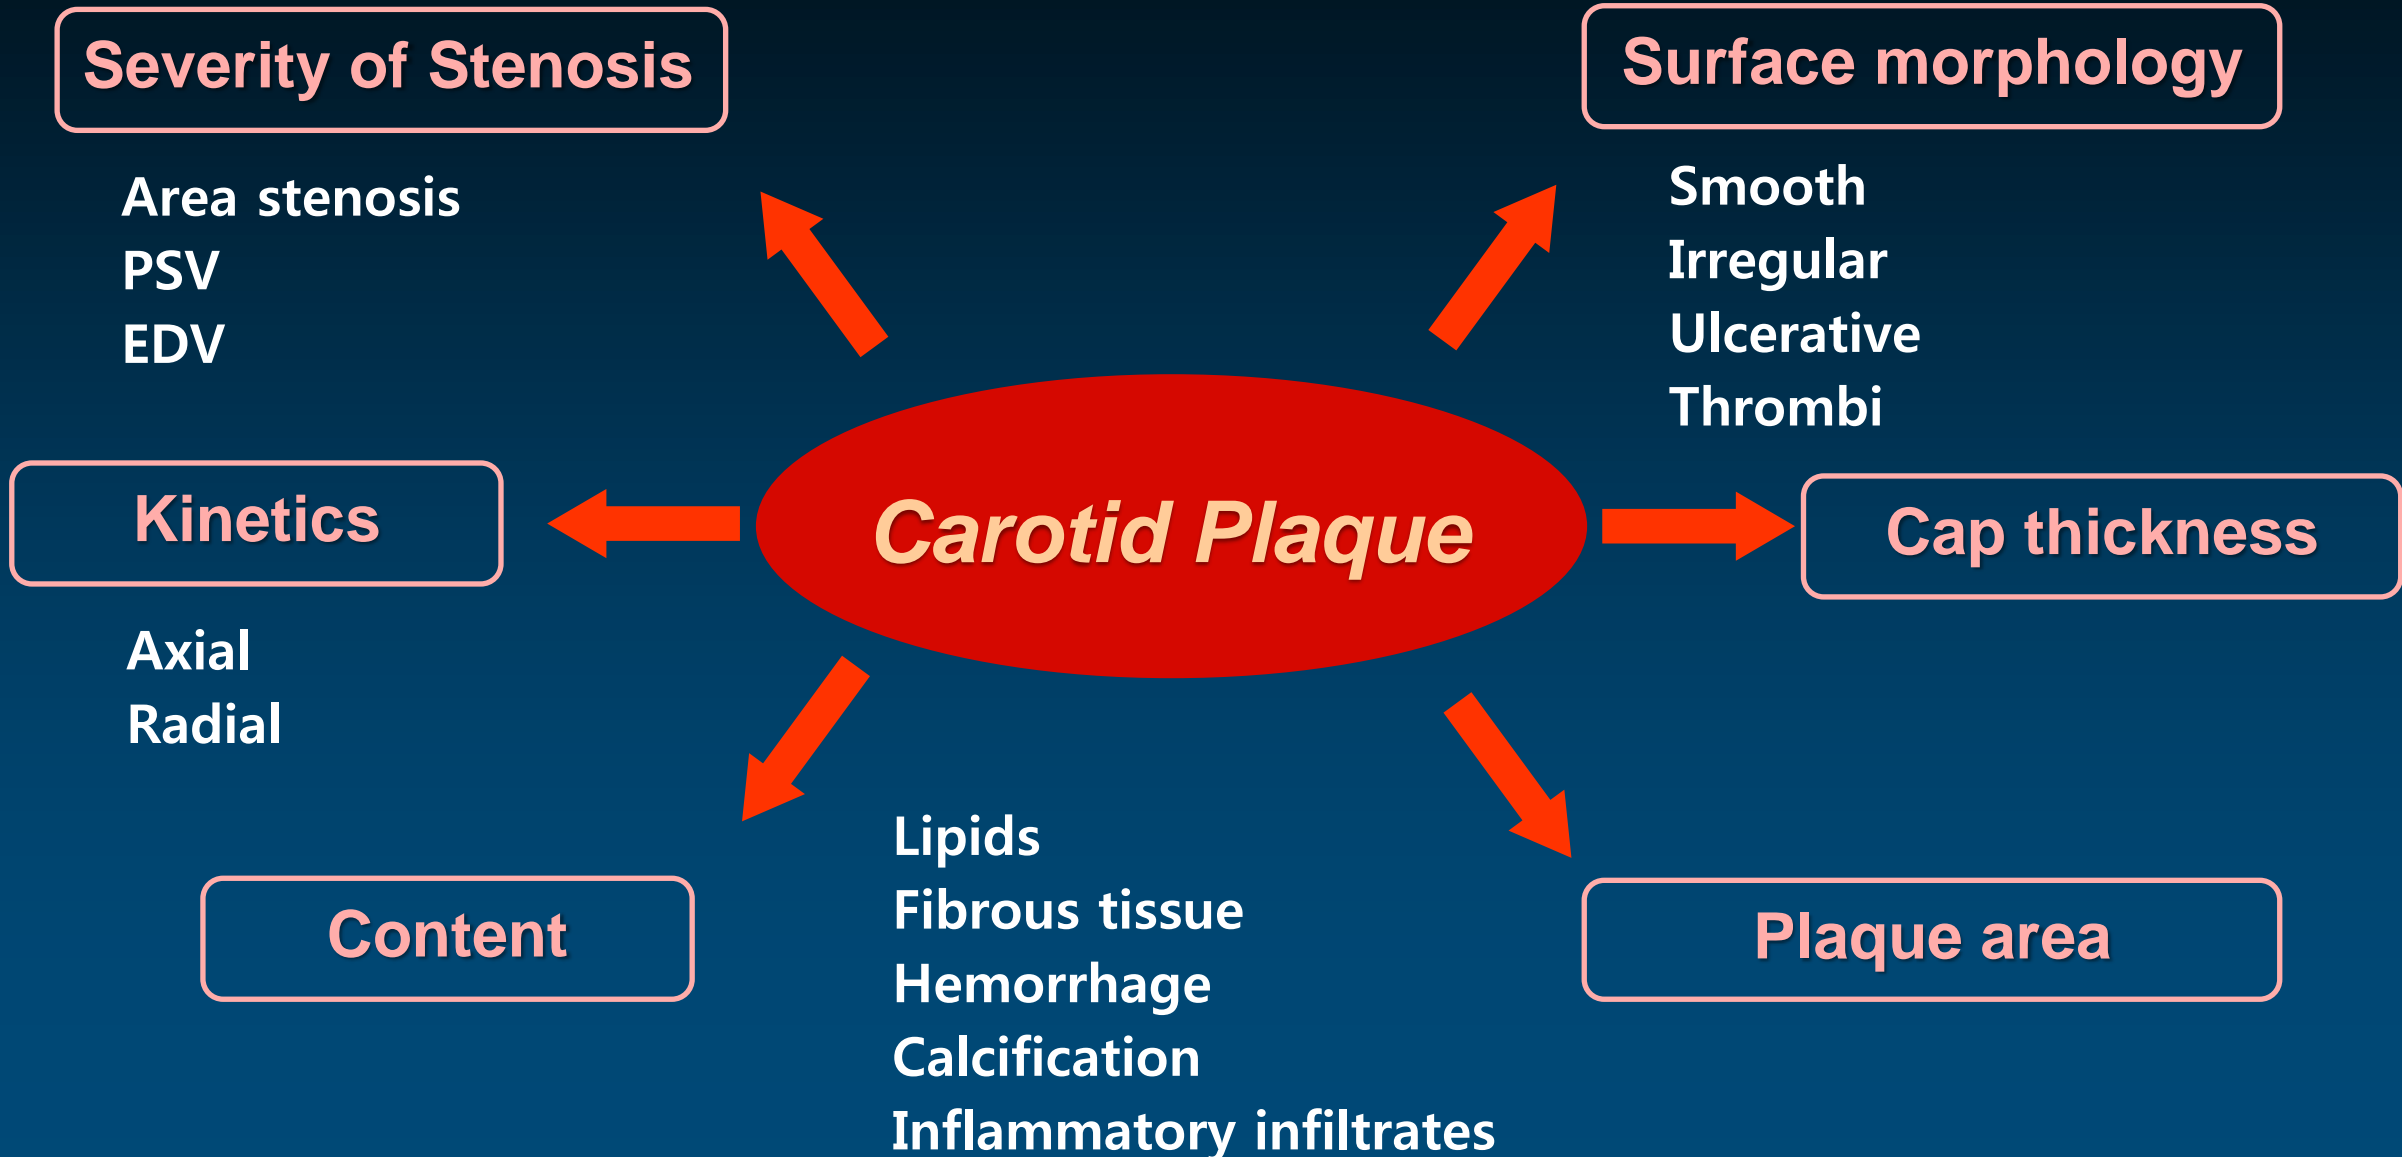

Irregular surface with visible thrombi

Huge ulceration

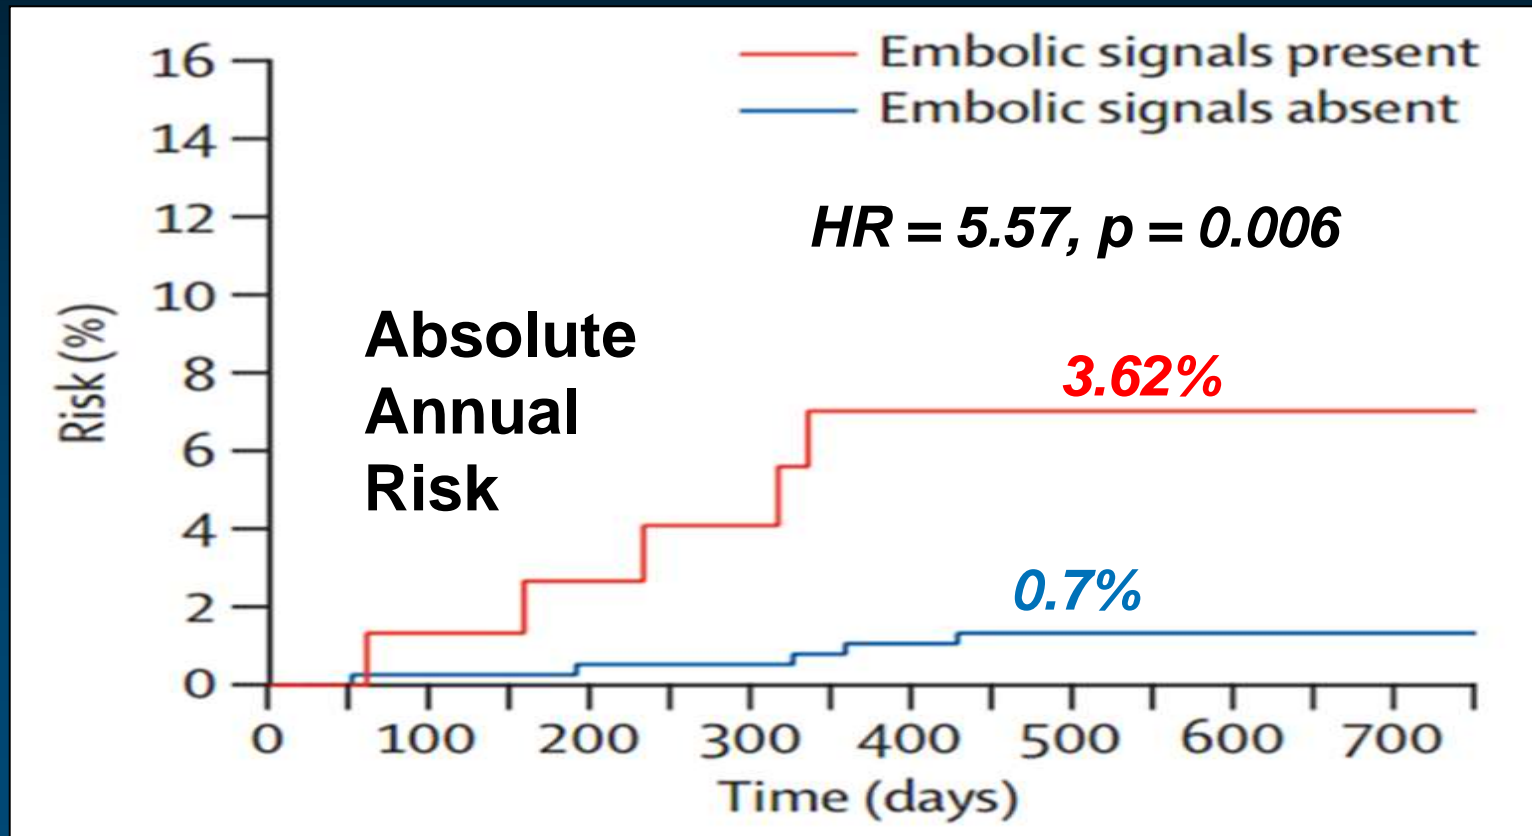

High Risk Predictors; Duplex USG

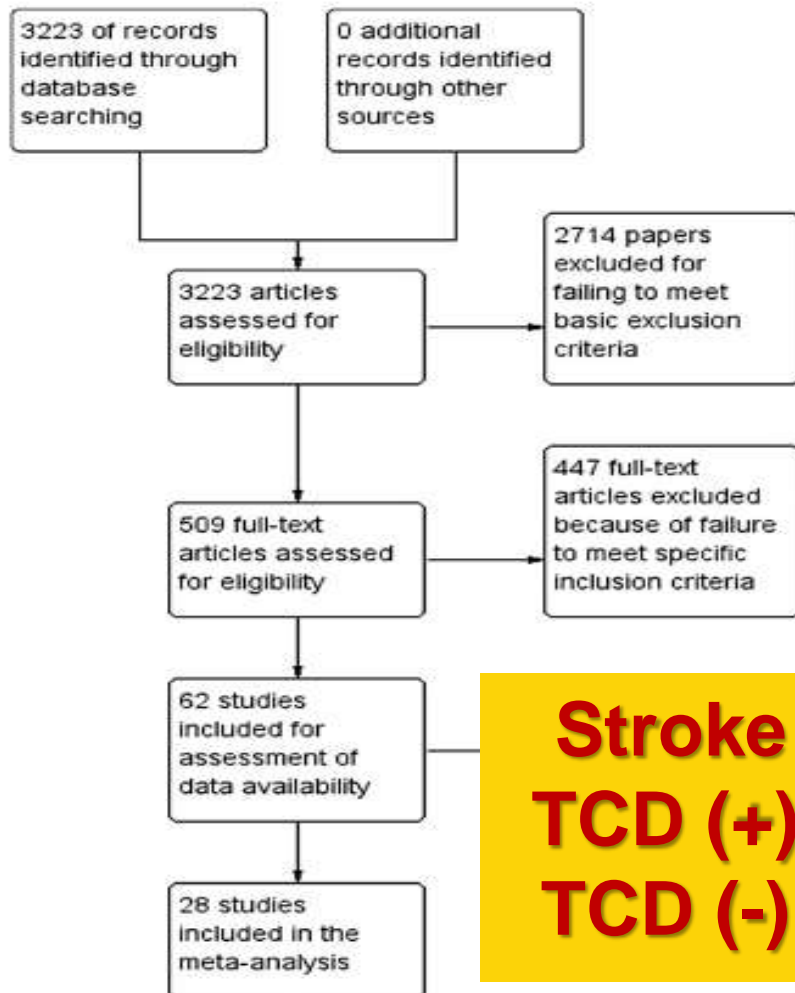

TCD Microembolic Signal & ASx Carotid Stenosis

Ipsilateral Stroke/TIA

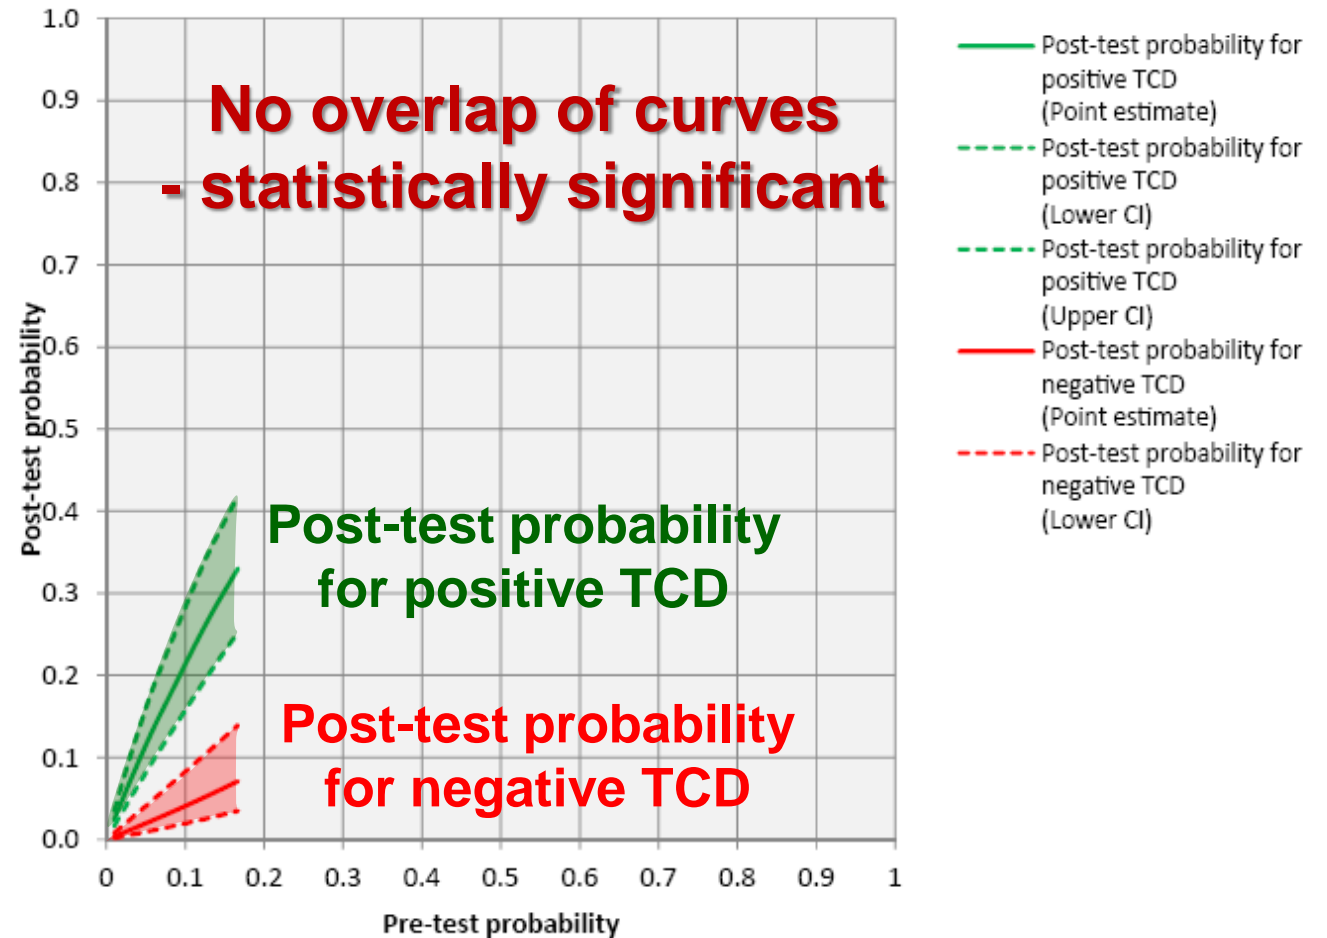

TCD Microembolic Signal & ASx Carotid Stenosis

TCD MES Meta Analysis Data

Stroke Risk
TCD (+) 7.1%
TCD (-) 1.2%

Silent Embolic Infarcts & ASx Carotid Stenosis

Annual Ipsilateral Stroke Rate

Stroke Rate			
Stenosis	No Infarct	Infarct*	p-value
<60%	1.1%	0.48%	NS
60–99%	1.0%	3.6%	0.002

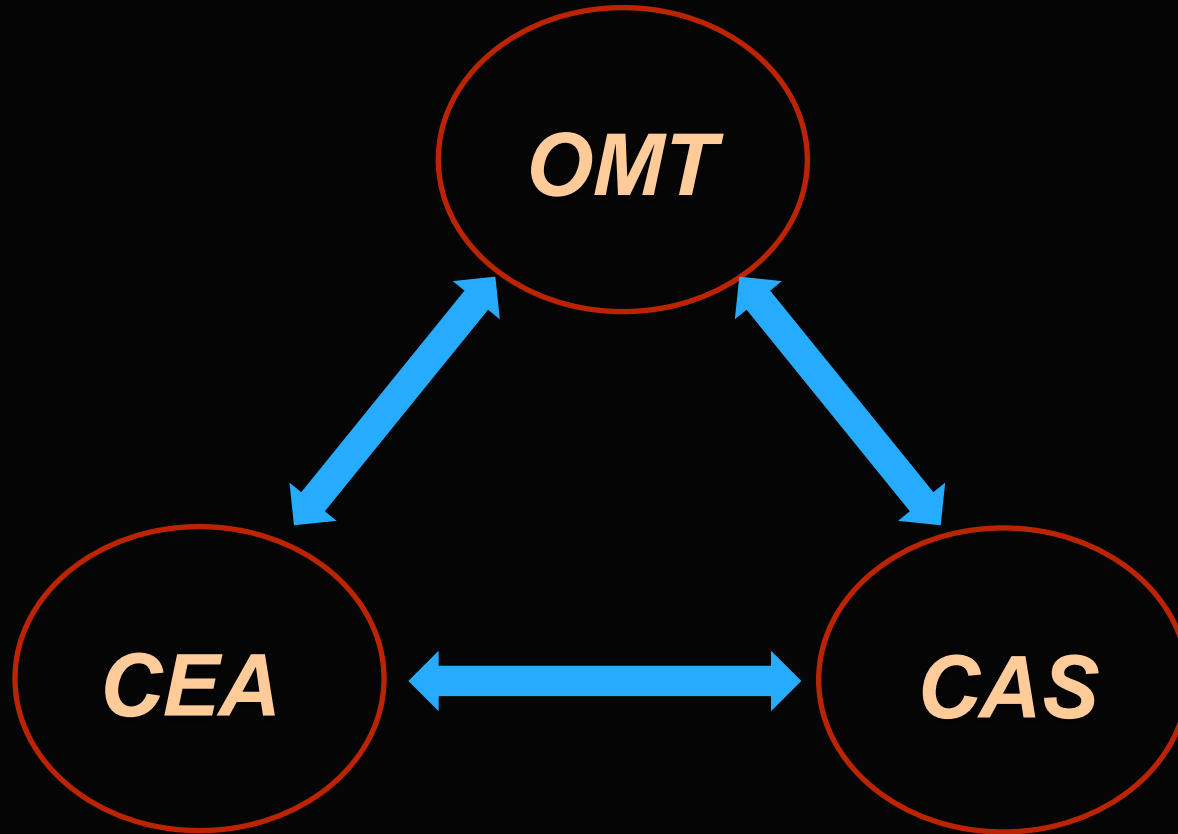

*CT scans

Contralateral Stroke & ASx Carotid Stenosis

Asymptomatic Severe Carotid Stenosis

Three Treatment Options

Asymptomatic Severe Carotid Stenosis

When Do We Revascularize?

- Life expectancy ≥ 5 years
- High risk imaging features

Silent cerebral infarction, stenosis progression

Plaque area on computerized plaque analysis $>80 \text{ mm}^2$

JBA on computerized plaque analysis $>8 \text{ mm}^2$

Intraplaque hemorrhage, Impaired CVR

Plaque lucency on Duplex US, Spontaneous embolization on TCD

Contralateral TIA/Stroke, Contralateral carotid occlusion

- Fully informed consent

CEA + BMT
should be considered

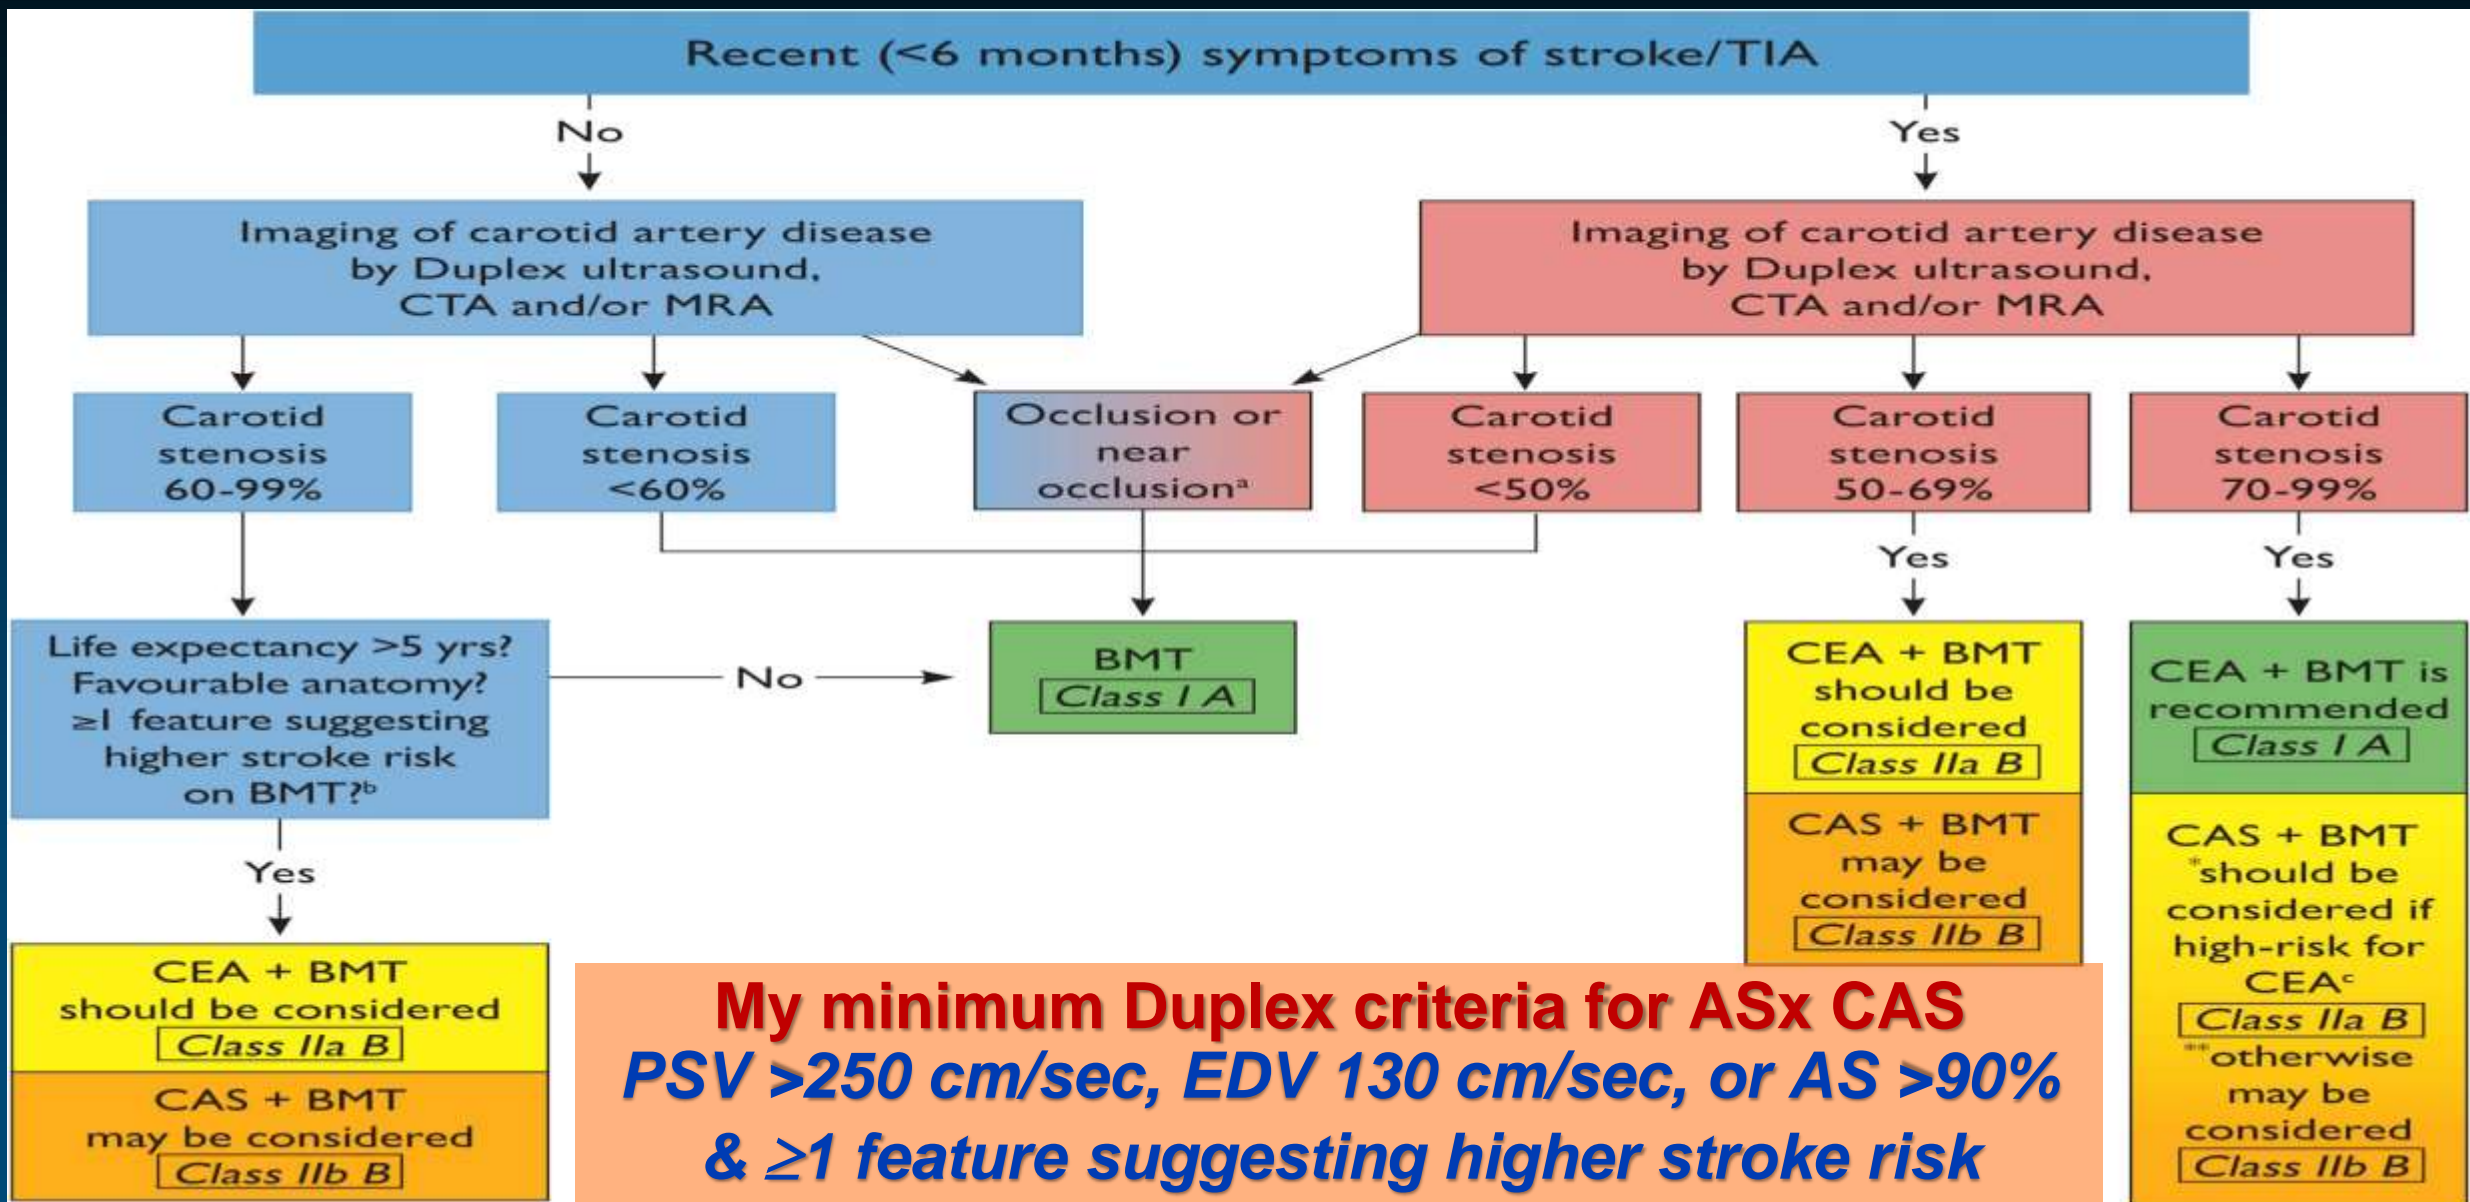

Class IIa B

CAS + BMT
may be considered

Class IIb B

Management Strategies for Asymptomatic Carotid Stenosis

2017 Clinical Practice Guidelines of the European Society for Vascular Surgery (ESVS)

My minimum Duplex criteria for ASx CAS
PSV >250 cm/sec, EDV 130 cm/sec, or AS >90%
& ≥1 feature suggesting higher stroke risk

Conclusion

ASx Carotid Stenosis; Who Is The High Risk?

- Numerous methods promising, but none yet proven
- Controversy will continue regarding the best treatment of ASx carotid stenosis
- The general condition of the patient, concomitant diseases, the degree and characteristics of the lesion, and the risk of CEA / CAS should be considered as a whole.

Treatment Strategy for ASx Carotid Stenosis

We **Thanks for Your Attention** arn
