# Symplicity HTN-1

## THE LANCET

Volume 373 Number 9573 Pages 1275-1281 April 11-17, 2009

www.thelancet.com

**Catheter-based renal sympathetic denervation for resistant hypertension: a multicentre safety and proof-of-principle cohort study**

Henry Khim, Markus Schlicht, Rob Whitburn, Paul A Sobczak, Jerzy Sosowski, Krzysztof Bartus, Bogusław Kupceak, Anthony Wilton, Horst Sievert, Suku Thambae, William T Abraham, Murray Esler

*Lancet.* 2009;373:1275-1281

## Hypertension

Celebrating 30 Years: 1979 to 2009

JOURNAL OF THE AMERICAN HEART ASSOCIATION

**Catheter-Based Renal Sympathetic Denervation for Resistant Hypertension**

**Durability of Blood Pressure Reduction Out to 24 Months**

Symplicity HTN-1 Investigators\*

*Hypertension.* 2011;57:911-917.

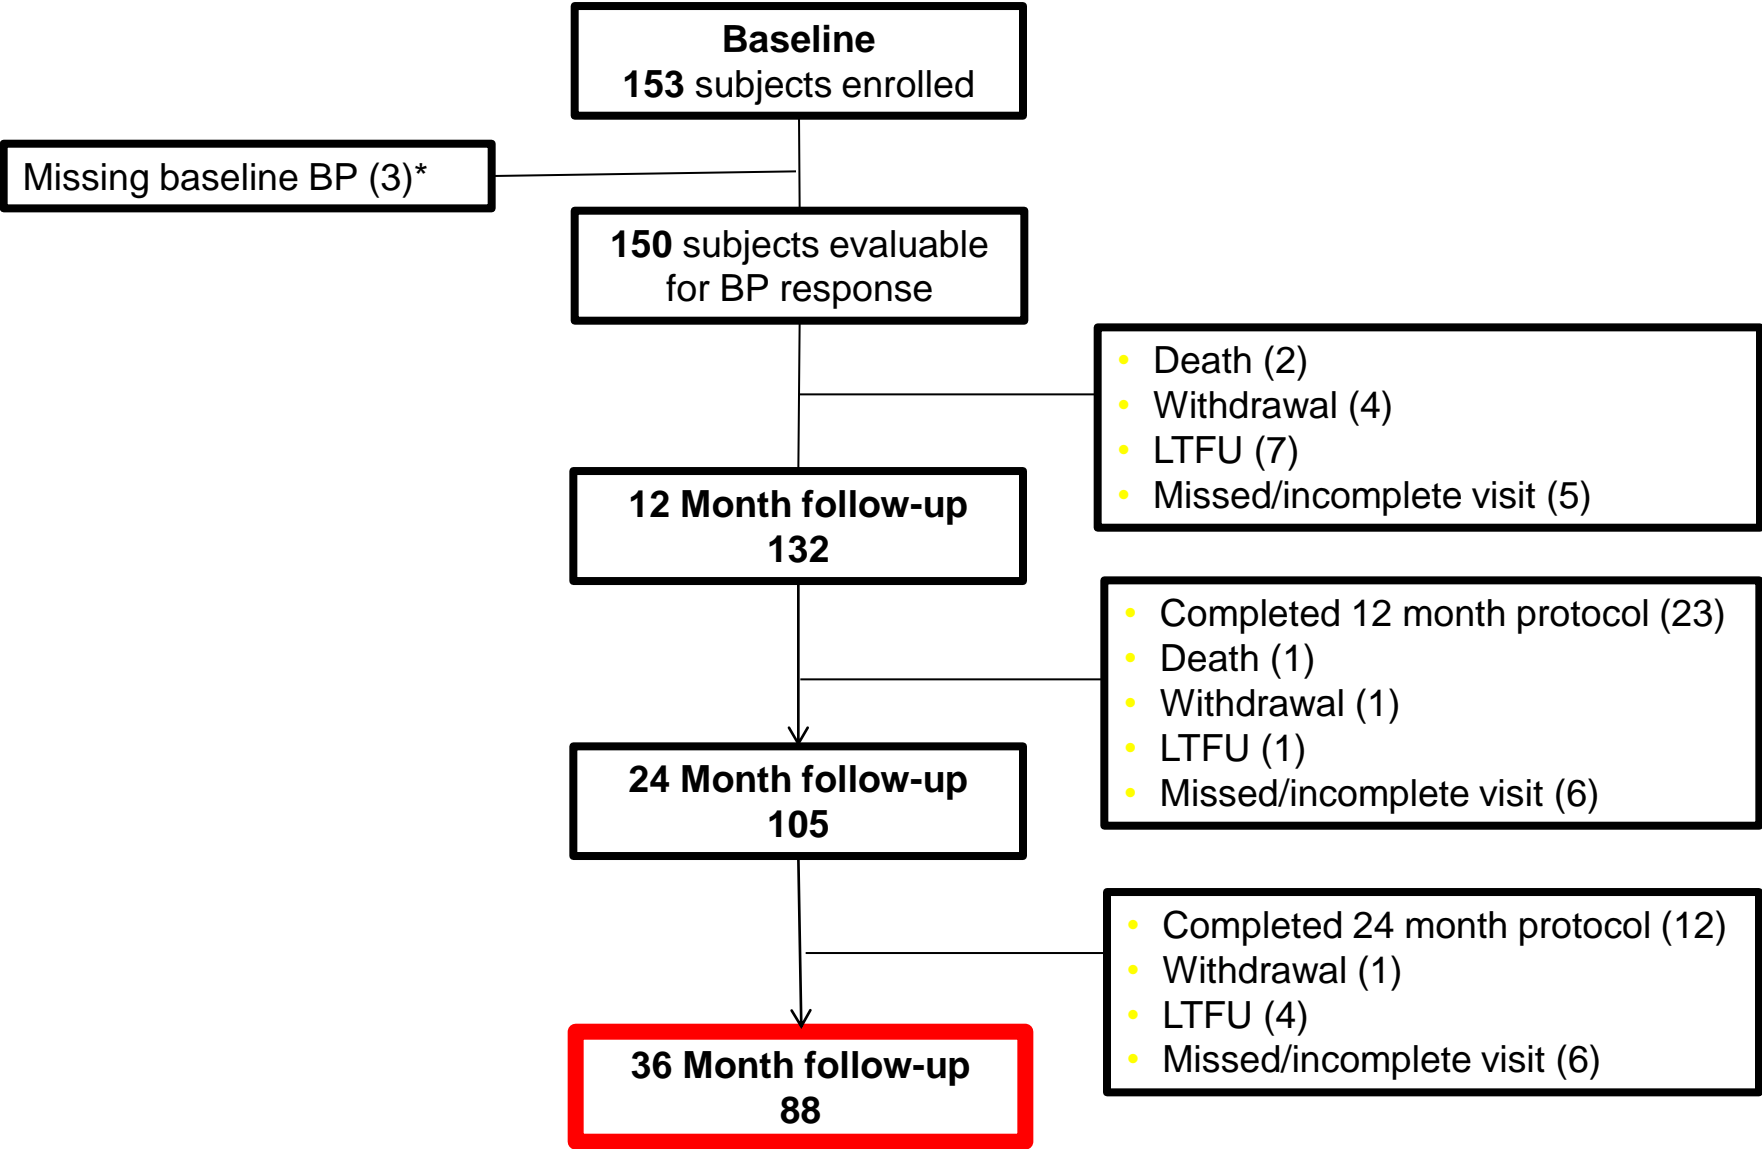

### Initial Cohort – Reported in the *Lancet*, 2009:

- First-in-man, non-randomized
- Cohort of 45 patients with resistant HTN (SBP  $\geq$ 160 mmHg on  $\geq$ 3 anti-HTN drugs, including a diuretic; eGFR  $\geq$  45 mL/min)

### Expanded Cohort – initially reported in *Hypertension*, 2011, updated

- n=153
- 36 -month follow-up

# Symplicity HTN 3: Patient Disposition 2013

# SYMPPLICITY HTN-1

Shows Long-Lasting Changes in Office Blood Pressure  
Mean BP decrease in 88 patients seen until 30 months

# Achievement of BP Goals (All Patients)

# Achievement of BP Goals (n=88)

# Laboratory Results to 36-Months

Mean $\pm$ SD	Na+ (mmol/L)	K+ (mmol/L)	SCr ( $\mu$ mol/L)	eGFR (mL/min/1.7 3m <sup>2</sup> )
<b>Baseline</b>	140.4 $\pm$ 3.9 (143)	4.1 $\pm$ 0.6 (145)	83.8 $\pm$ 20.1 (143)	83.6 $\pm$ 19.7 (145)
<b>3 Months</b>	140.4 $\pm$ 3.1 (125)	4.1 $\pm$ 0.5 (125)	85.8 $\pm$ 22.6 (132)	82.6 $\pm$ 21.0 (132)
<b>6 Months</b>	140.5 $\pm$ 3.2 (136)	4.1 $\pm$ 0.4 (136)	85.2 $\pm$ 20.1 (142)	82.6 $\pm$ 20.9 (142)
<b>12 Months</b>	140.1 $\pm$ 3.3 (130)	4.0 $\pm$ 0.4 (129)	85.4 $\pm$ 19.8 (130)	81.8 $\pm$ 19.5 (130)
<b>24 Months</b>	139.9 $\pm$ 3.0 (43)	4.1 $\pm$ 0.4 (43)	92.9 $\pm$ 29.8 (43)	76.8 $\pm$ 22.8 (43)
<b>36 Months</b>	139.7 $\pm$ 243 (29)	4.2 $\pm$ 0.9 (29)	92.0 $\pm$ 32.5 (28)	74.3 $\pm$ 28.0 (29)

**P<0.05**

**N=29**

**Needs to be further analyzed**

# Possible renal artery stenosis out to 36-Months

	<b>0-6 Months</b>	<b>&gt; 6-18 Months</b>	<b>&gt; 18-36 Months</b>
<b>Hemodynamically stable, no intervention required</b>	<b>1</b>	<b>1</b>	<b>-</b>
<b>Stented without sequelae</b>	<b>-</b>	<b>-</b>	<b>1</b>
<b>Non-significant, no intervention required</b>	<b>-</b>	<b>1</b>	<b>-</b>

# Adverse events out to 36-Months

- 1 patient with Hypotension and Renal Failure (18 m)
  - Due to sepsis; successfully treated; Renal failure resolved
- 1 patient with Hypotension and Renal Failure (24 m)
  - Post-operative hypovolemia with continuation of antihypertensive medications leading to acute tubular necrosis (ATN)
  - Responded to treatment and ATN resolved
- Hypotension Episode
  - Associated with severe diarrhoea and dehydration
  - Resolved without further incident
  - Two episodes Orthostatic Hypotension in 1 patient (Both resolved)
- Hypertensive episodes
  - 13 subjects requiring hospitalization
- Death
  - Myocardial infarction, after 3<sup>rd</sup> day
  - Sudden cardiac death, after 6 months
  - Cardio-respiratory arrest, after 18 months

# SYMPPLICITY HTN-2

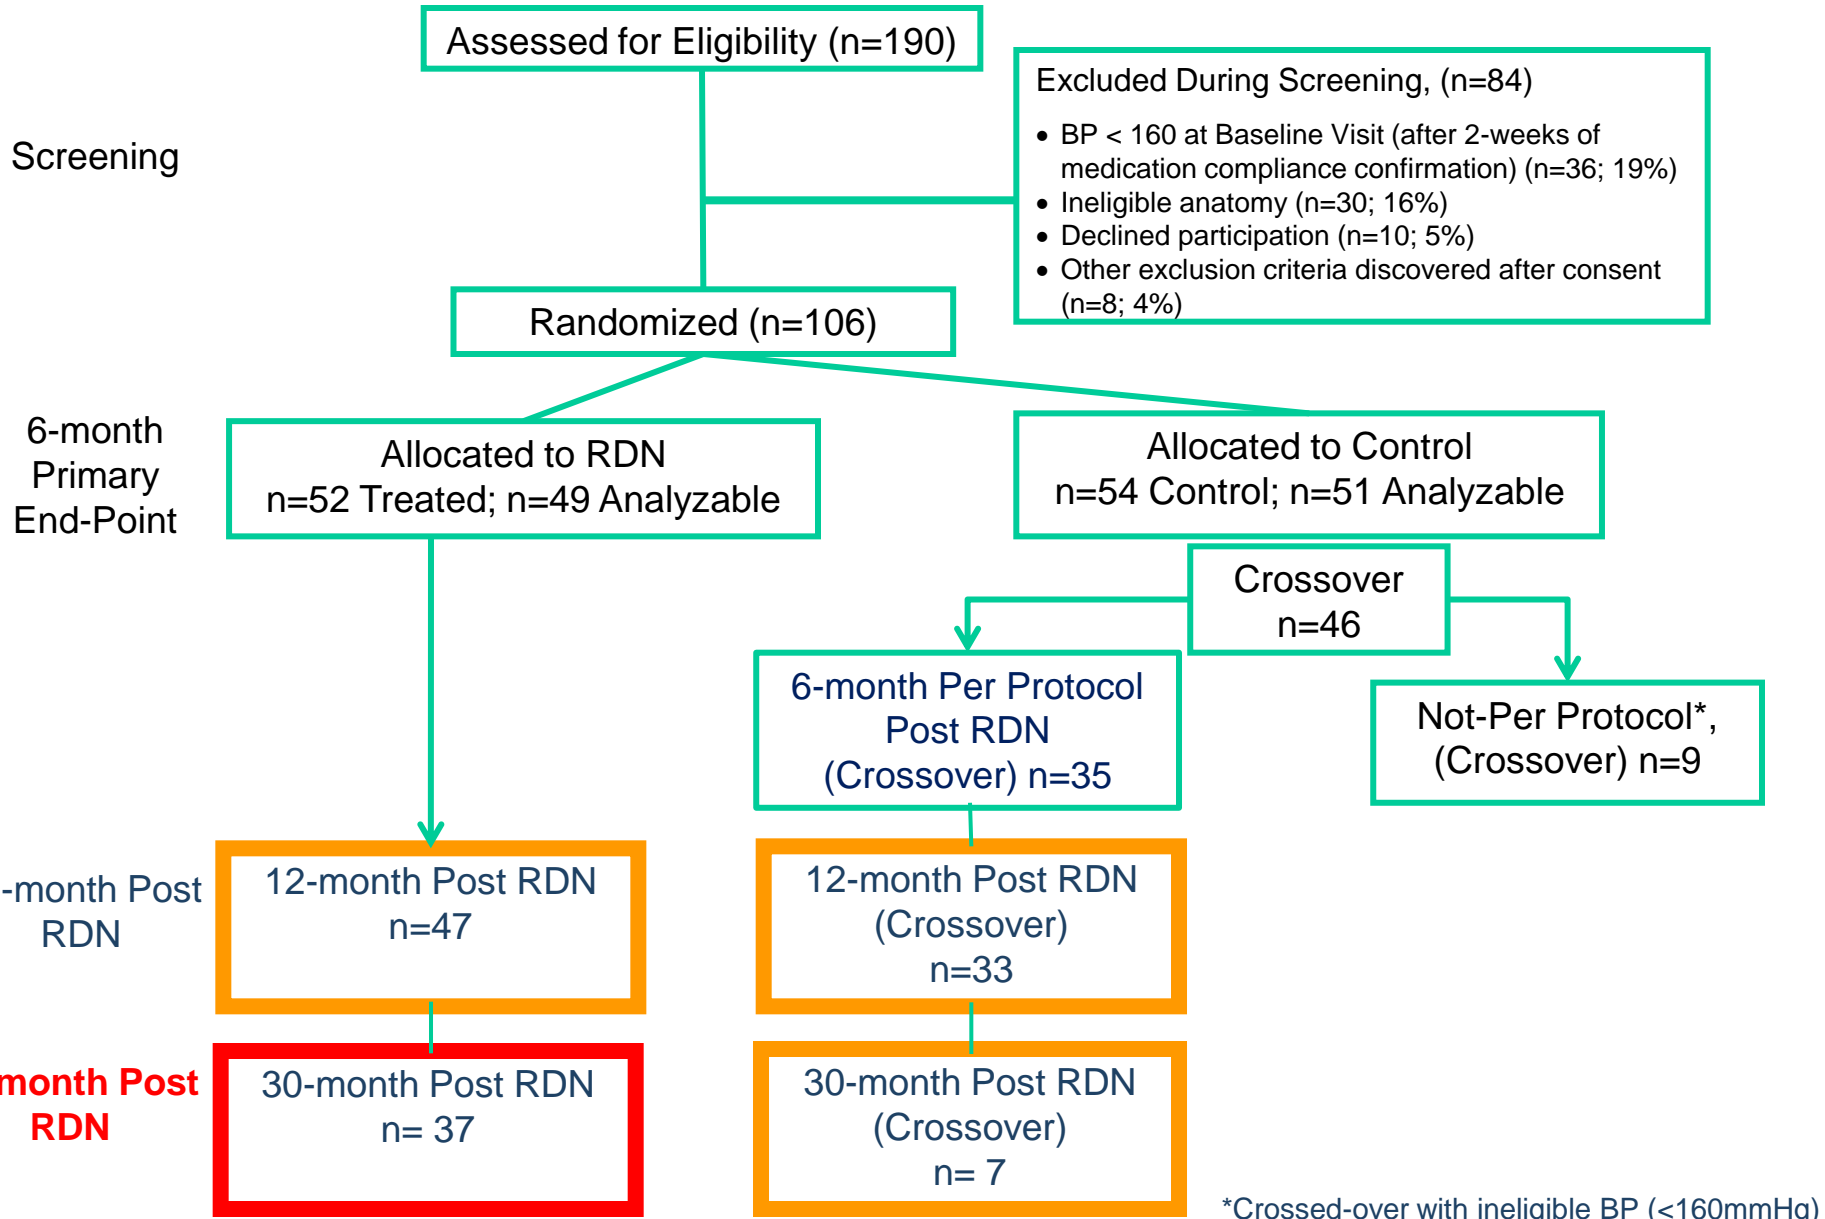

- Multicenter Phase II feasibility study  
June 2009 - January 2010
  - 24 centers
- Primary efficacy endpoint
  - 6 month office based BP
- 190 patients eligible, 106 randomized
  - 49 treated, 51 controls

# Primary Endpoint: 6-Month Office BP

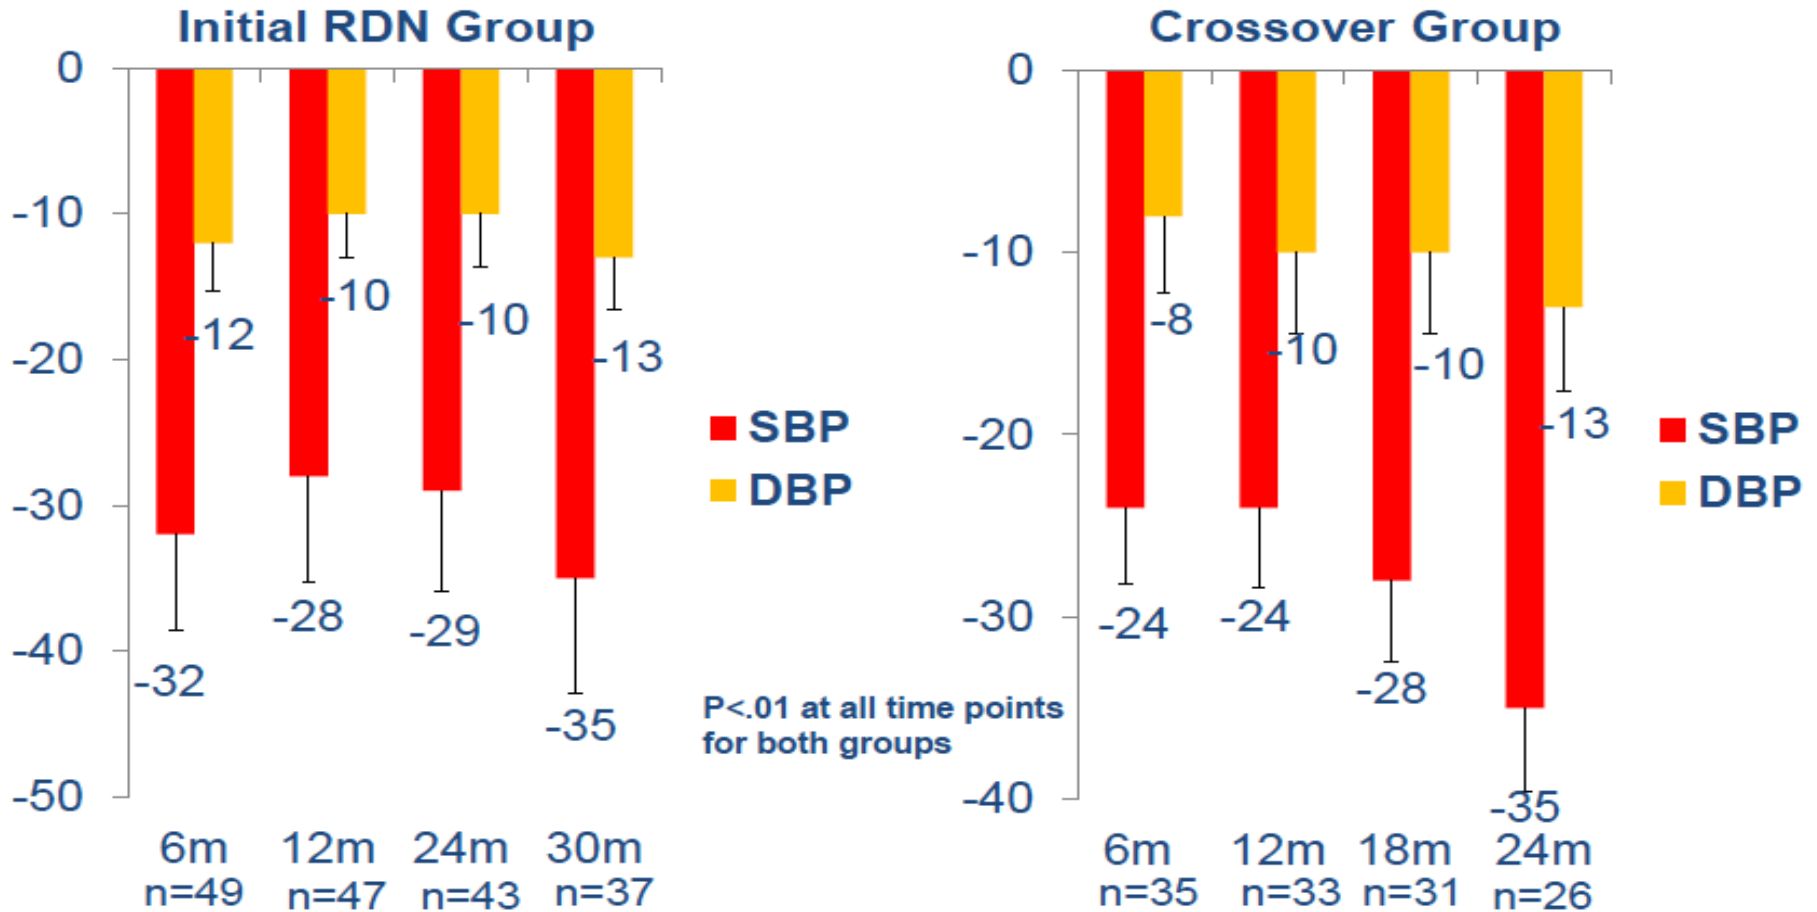

- 84% of RDN patients had  $\geq 10$  mmHg reduction in SBP
- Only 10% of RDN patients had no reduction in SBP

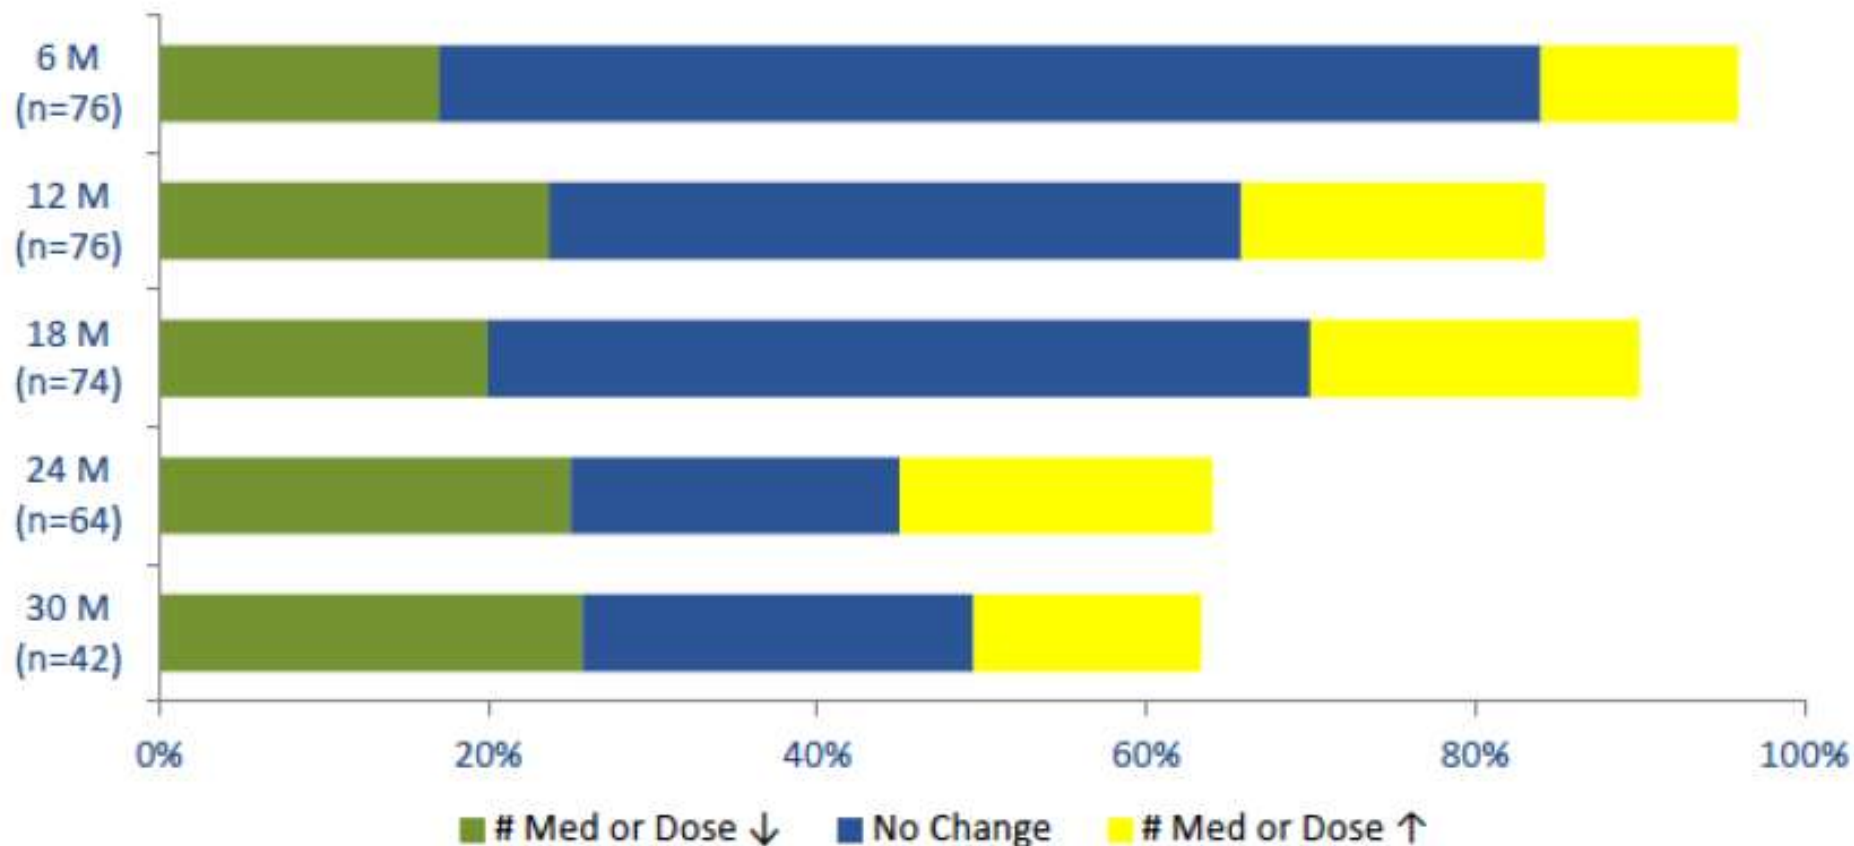

# Patient Disposition

# SYMPPLICITY HTN-2 Shows Decrease in Office BP at 30 Months

# SYMPPLICITY HTN-2 Shows no Change or Decrease in Overall Medications After Procedure

Physicians were encouraged to maintain medications and dosages up to the 6-month primary endpoint.

Increase: if any or both meds and/or dose increase, Decrease: if any or both meds and/or dose decrease.

Values may not total to 100% due to indeterminate modifications, e.g., combination of med/dose increase and decrease.

# SYMPPLICITY HTN-2 shows few adverse events through 30m

- Procedural
  - 1 hematoma, 1 dissection
- 0-12 months
  - 9 hypertensive events needing hospitalization
  - 2 hypotensive events needing hospitalization
- 12-30 months
  - 3 hypertensive events requiring hospitalization
  - 1 mild transient acute renal failure
  - 2 deaths unrelated to device or therapy
- No Change in GFR, No Renal Artery Stenosis

# Symplicity HTN 3

- Multi-center, randomized, blinded, sham controlled
- 535 patients
- 88 centers
- Main inclusion criteria
  - Age  $\geq 18$  and  $\leq 80$  years
  - Stable medication regimen
    - including full tolerated doses of 3 or more antihypertensive medications of different classes, including a diuretic
    - with no changes for a minimum of 2 weeks prior to screening
  - Office Systolic BP  $\geq 160$  mm Hg
- Main exclusion criteria
  - ABPM 24 hour average Systolic BP  $< 135$  mm Hg
  - eGFR of  $< 45$  mL/min/1.73 m<sup>2</sup>
  - Anatomical criteria

# HTN-3: Primary Endpoints

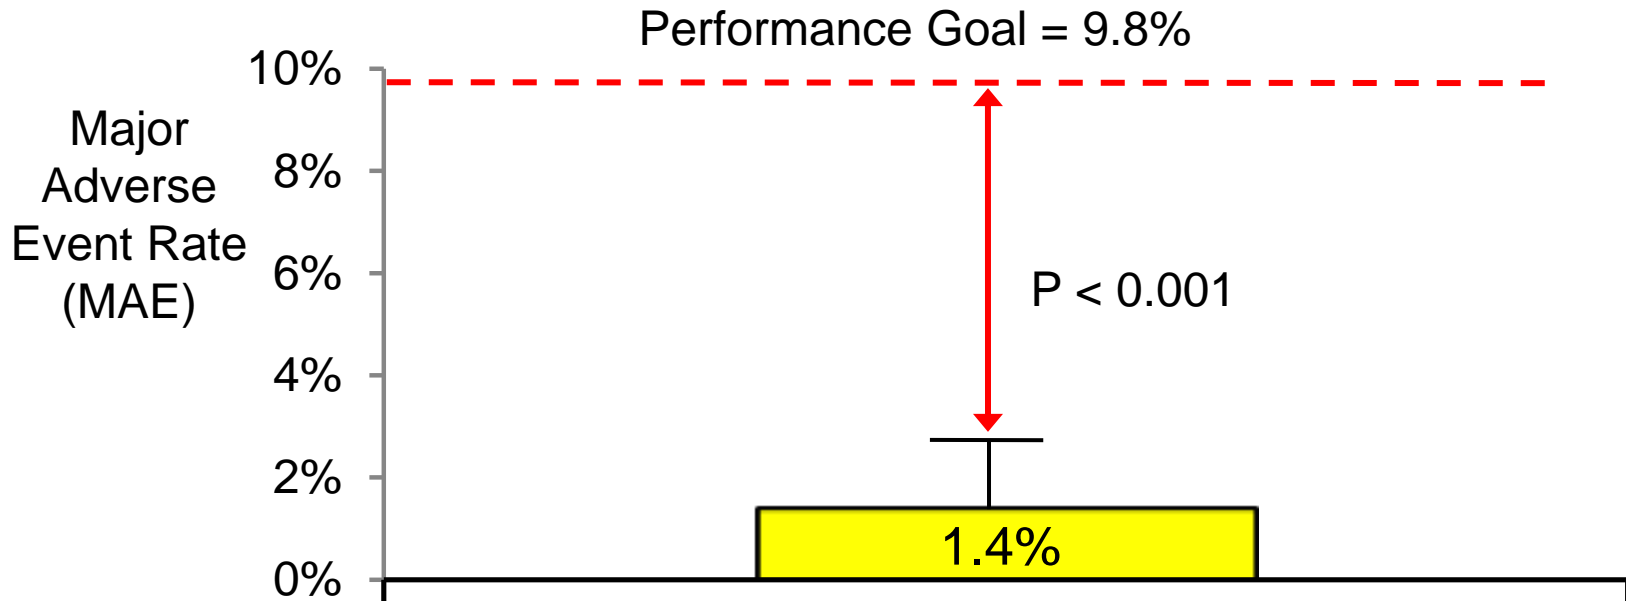

- Safety endpoint
  - Major Adverse Events (MAE) in the treatment group compared with an Objective Performance Criterion (OPC = 9.8% - derived from historical data)
- Efficacy endpoint
  - Comparison of office SBP change from baseline to 6 months in RDN arm compared with change from baseline to 6 months in control arm
    - Endpoint =  $(\text{SBP}_{\text{RDN 6 month}} - \text{SBP}_{\text{RDN Baseline}}) - (\text{SBP}_{\text{CTL 6 month}} - \text{SBP}_{\text{CTL Baseline}})$
  - *Superiority margin of 5 mm Hg*

# Results: Population Demographics

	Renal Denervation (N=364)	Sham Procedure (N=171)	P
Age (years)	57.9 ± 10.4	56.2 ± 11.2	0.09
Male sex (%)	59.1	64.3	0.26
Office systolic blood pressure (mm Hg)	180±16	180±17	0.77
24 hour mean systolic ABPM (mm Hg)	159±13	160±15	0.83
BMI (kg/m <sup>2</sup> )	34.2 ± 6.5	33.9 ±6.4	0.56
Race* (%)			0.57
African American	24.8	29.2	
White	73.0	69.6	
Medical history (%)			
Renal insufficiency (eGFR<60 ml/min/1.73m <sup>2</sup> )	9.3	9.9	0.88
Renal artery stenosis	1.4	2.3	0.48
Obstructive sleep apnea	25.8	31.6	0.18
Stroke	8.0	11.1	0.26
Type 2 diabetes	47.0	40.9	0.19
Hospitalization for hypertensive crisis	22.8	22.2	0.91
Hyperlipidemia	69.2	64.9	0.32
Current smoking	9.9	12.3	0.45

\*Race also includes Asian, Native American, or other

# HTN-3 Primary Safety Endpoint

	Renal Denervation (N=364)	Sham Procedure (N=171)	Difference [95% CI]	P*
MAE	1.4% (5/361)	0.6% (1/171)	0.8% [-0.9%, 2.5%]	0.67

# Primary Efficacy Endpoint

$\Delta = -2.39$  (95% CI, -6.89 to 2.12)

$P=0.26^*$

\*P value for superiority with a 5 mm Hg margin; bars denote standard deviations

# HTN-3 Prespecified Subgroup Analyses

\* P value for superiority with margin of 5 mm Hg

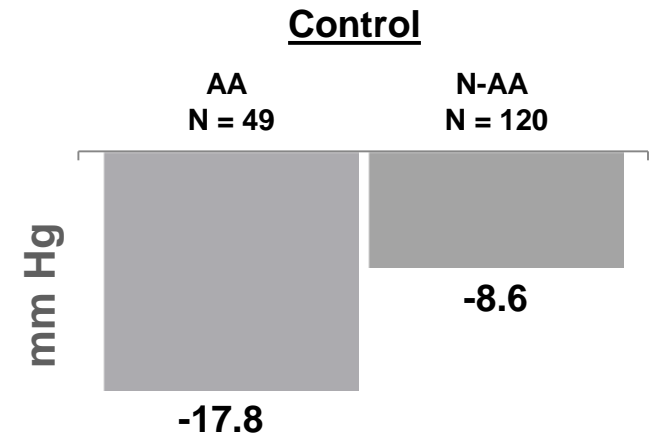

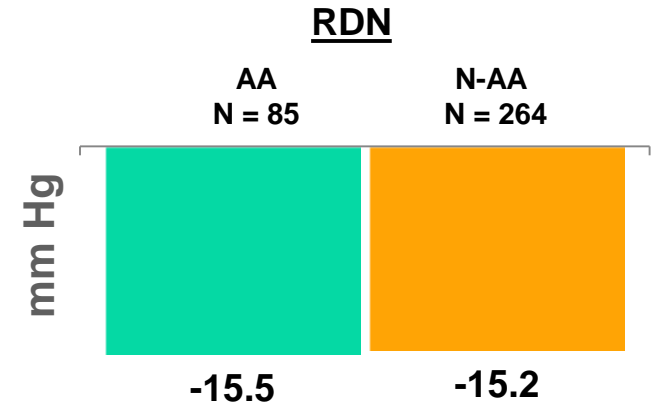

# Why did HTN-3 fail?

Multiple potential reasons

# Demographics and Control Group Impact

	African American Control (N = 50)	Non-African American Control (N = 121)
OBP at baseline	183.9 ± 19.8	178.6 ± 10.7
Age	52.4 ± 10.7	57.8 ± 11.1
Male	54.0%	68.6%
Smoking	30.0%	47.1%
Type 2 diabetes	34.0%	43.8%
Hypercholesterolemia	56.0%	68.6%
History of sleep apnea	26.0%	33.9%
No. of antihypertensive medications	5.5 ± 1.6	5.1 ± 1.3
Vasodilator usage at baseline	56.0%	40.5%

Vasodilators are dosed up to 4x daily, making compliance a challenge

# HTN-3: Procedural Experience

	HTN-1	HTN-3
No. of operators	20	112
No. of procedures per operator	6.0	3.3
No. of procedures per site	8.6	4.7

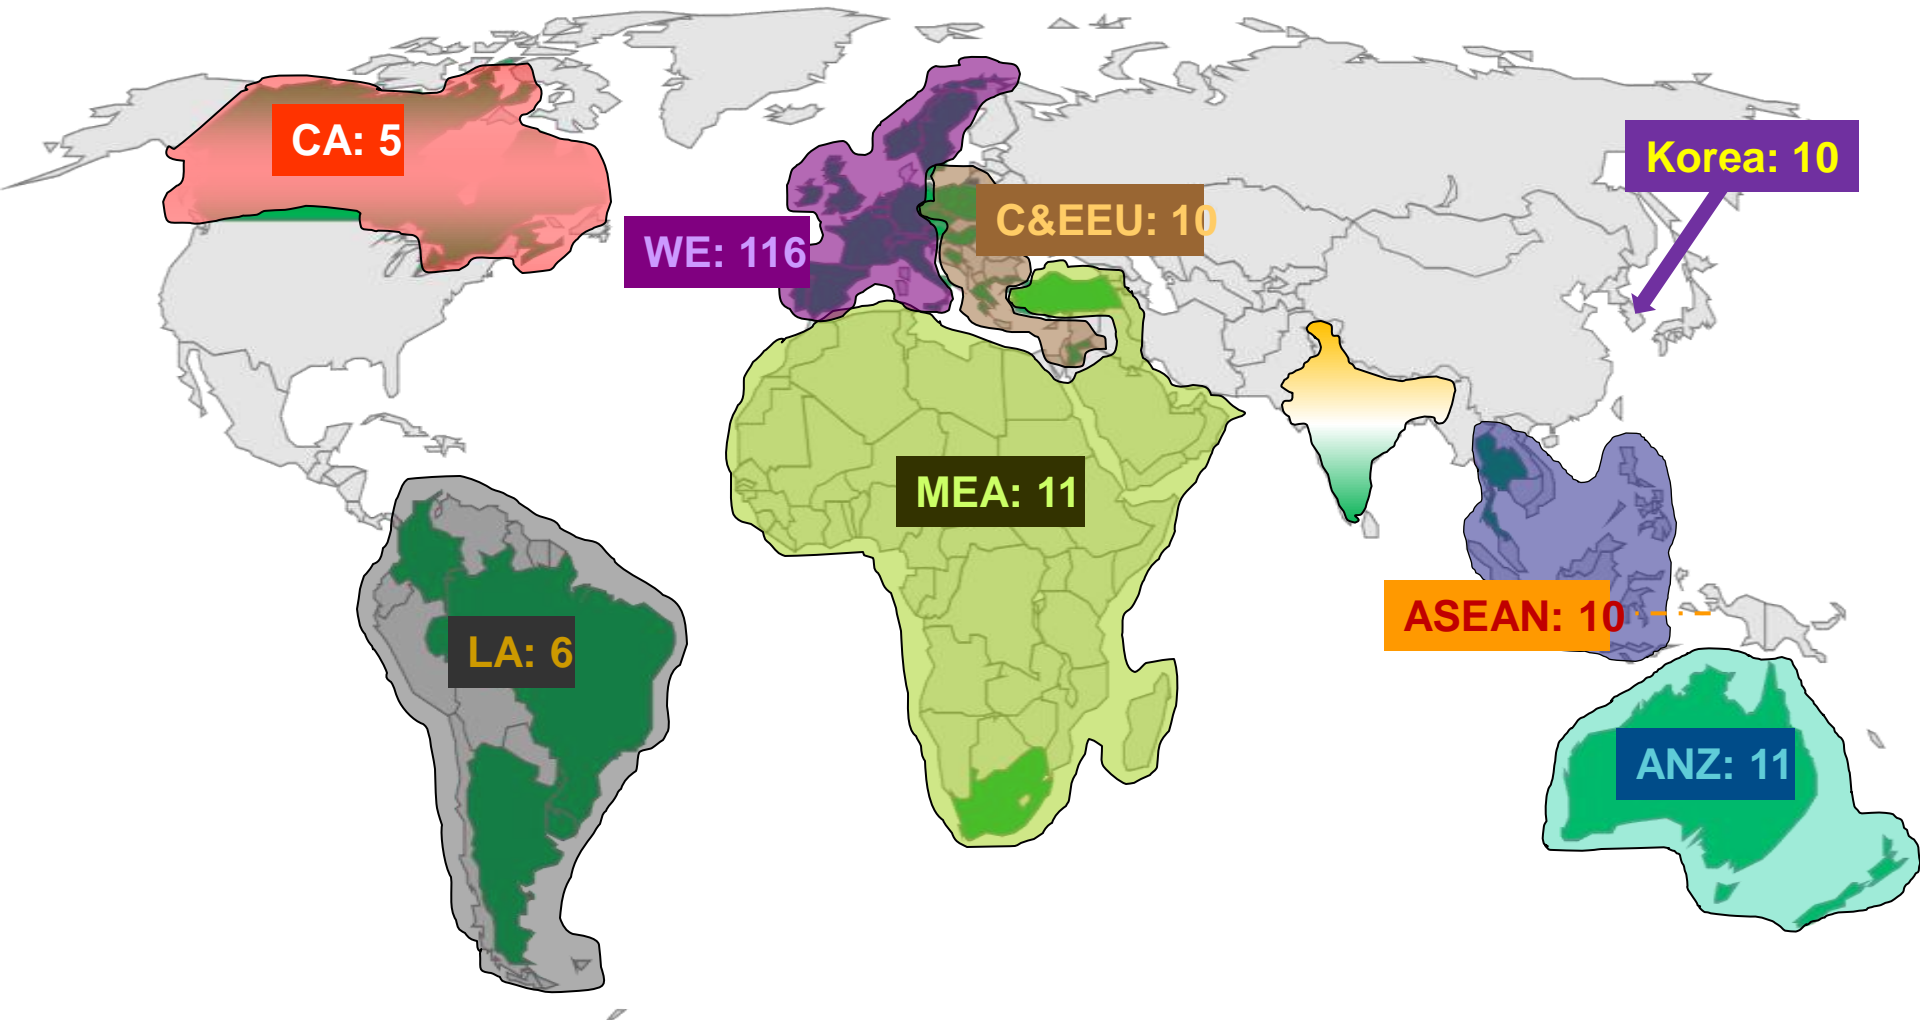

- a) 5X more operators vs HTN-1
- b) Greater heterogeneity of operator experience vs. HTN-1 and HTN-2
- c) Case proctoring was different and not comparable

# Global SYMPLICITY Registry

- Prospective, open label, multi-center, international registry
- Up to 5000 real world patients with uncontrolled hypertension and some with conditions associated with sympathetic nervous system activation
- Key Inclusion:
  - Older than 18 years
  - Clinical candidates for renal denervation

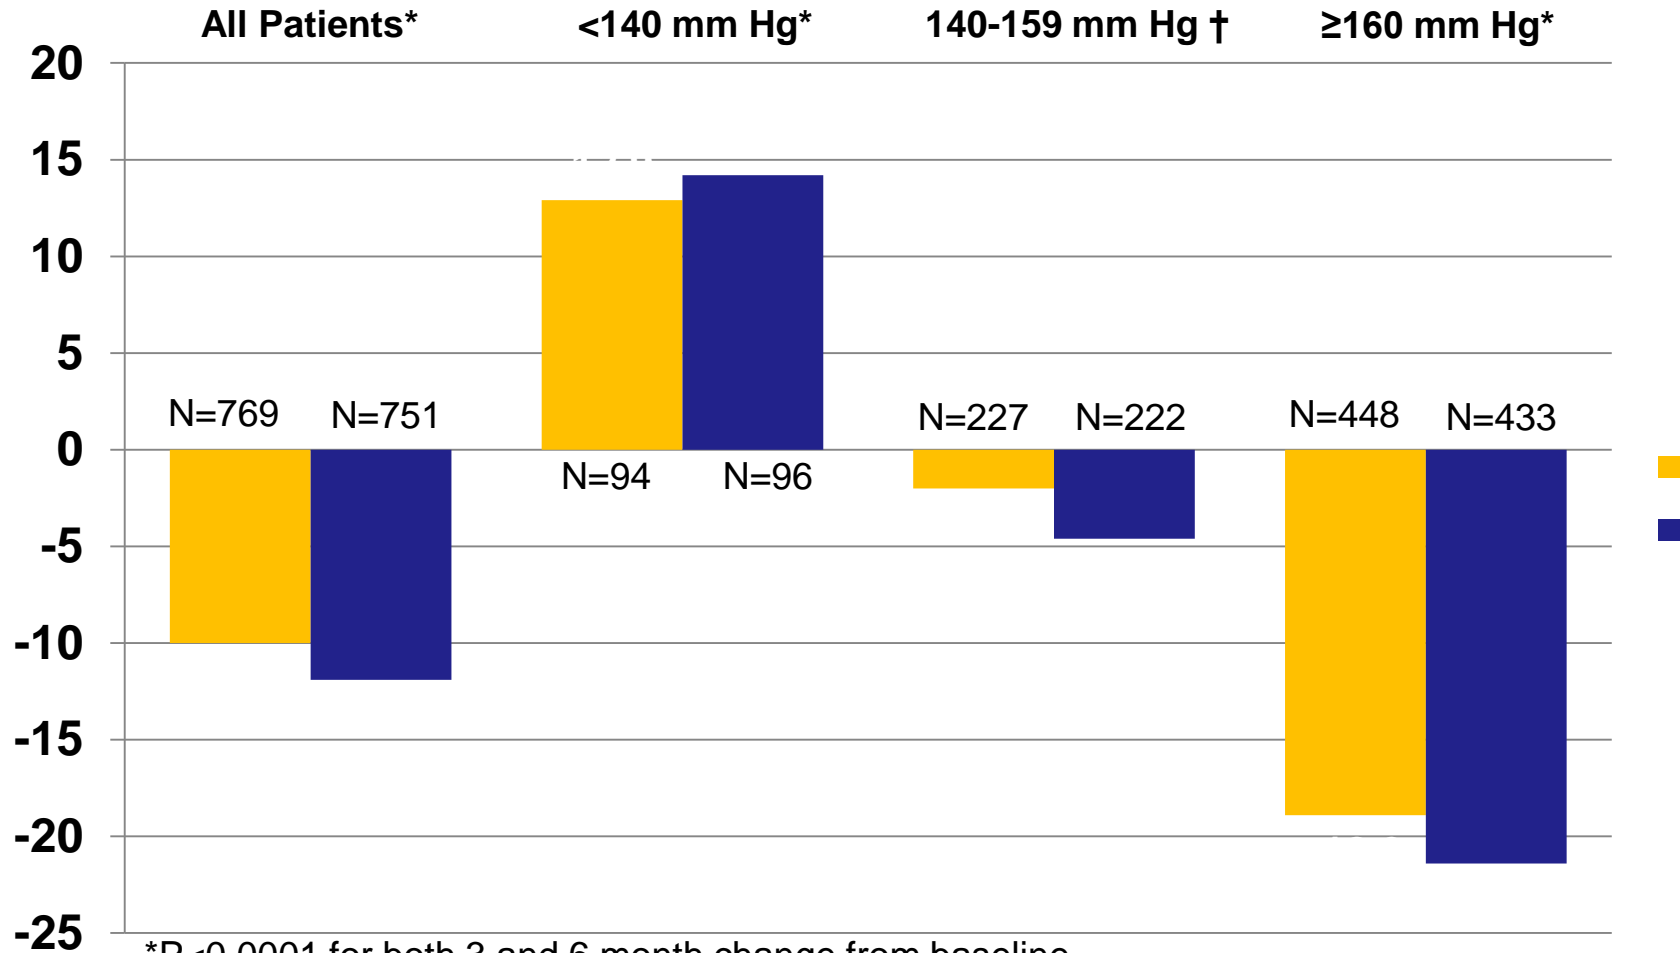

# Study Centers

# Safety in HTN-3 and GSR

	<b>HTN-3 RDN arm (N=364)</b>	<b>GSR All Patients (N=1000)</b>	<b>GSR OSBP<math>\geq</math>160 and ABPM<math>\geq</math>135* (N=327)</b>
<b>MAE</b>	<b>1.4%</b>	<b>0.8%</b>	<b>1.3%</b>
<b>At 6 month</b>			
<b>Death</b>	<b>0.6%</b>	<b>0.4%</b>	<b>0.3%</b>
<b>New onset end stage renal disease</b>	<b>0.0%</b>	<b>0.2%</b>	<b>0.3%</b>
<b>Significant embolic event resulting in end-organ damage</b>	<b>0.3%</b>	<b>0.0%</b>	<b>0.0%</b>
<b>Renal artery re-intervention</b>	<b>0.0%</b>	<b>0.2%</b>	<b>0.0%</b>
<b>Vascular complication</b>	<b>0.3%</b>	<b>0.4%</b>	<b>0.7%</b>
<b>Hypertensive crisis/emergency</b>	<b>2.6%</b>	<b>1.0%</b>	<b>1.7%</b>
<b>New renal artery stenosis &gt; 70%</b>	<b>0.3%</b>	<b>0.0%</b>	<b>0.0%</b>

# Change in Office Systolic BP for All Patients and Subgroups

\*P<0.0001 for both 3 and 6 month change from baseline

†P=0.14 at 3 months and P=0.0006 at 6 months

# ... and Guidelines?

- Almost all guidelines at least consider renal denervation as an option in resistant hypertension
- Recommendations usually follow the study protocols of HTN-1 and HTN-2
- Most guidelines recommend to exclude patients with renal insufficiency

# And guidelines after HTN-3 ?

- They did not change yet
- Most scientific societies did not react yet or reacted but did not say more than “data should be analyzed carefully”
- Which means you can continue to do renal denervation if you believe it is indicated in your patients

**The Joint UK Society's Working Group on Renal Denervation.  
Our initial response to the Medtronic Symplicity HTN3 announcement.**

Mark Caulfield<sup>1</sup> (Chair), Mark de Belder<sup>2</sup>, Trevor Cleveland<sup>3</sup>, David Collier<sup>1</sup>, Indranil Dasgupta, John Deanfield<sup>4</sup>, Charles Knight<sup>5</sup>, Melvin Lobo<sup>1</sup>, Matthew Matson<sup>3</sup>, Jon Moss<sup>3</sup>, Neil Poulter<sup>1</sup>, Iain Simpson<sup>5</sup>, Bryan Williams<sup>1</sup>.

On behalf of the British Hypertension Society<sup>1</sup>, the British Cardiovascular Intervention Society<sup>2</sup>, the British Society for Interventional Radiology<sup>3</sup>, National Institute for Clinical Outcomes Research<sup>4</sup>, the British Cardiovascular Society<sup>5</sup>, and the Renal Association<sup>6</sup>.

- While we await the data from Symplicity HTN3, we recommend a temporary moratorium on renal denervation procedures for all cases as part of routine care in the NHS and private practice in the UK.
- Our proposed temporary moratorium should not apply to clinical trials as there are many other technologies that are in development for renal denervation (including by Medtronic).

Cardiovascular and Interventional Radiological Society of Europe

## **Cardiovascular and Interventional Radiological Society of Europe (CIRSE) Brief Statement on RDN Study Cessations**

**Authored by the CIRSE Renal Denervation Task Force:** Jon Moss<sup>1</sup> (Chairman), Dierk Vorwerk<sup>2</sup>, Anna Maria Belli<sup>3</sup>, Jan Peregrin<sup>4</sup>, Mick Lee<sup>5</sup>, Jim Reekers<sup>6</sup>.

- An analysis of the Symplicity HTN-3 data is needed before an informed opinion can be reached.

ESH E-NEWSLETTER

## ESH STATEMENT ON SYMPLICITY HTN-3 RESULTS

The negative results of the Symplivity HTN-3 study (1) raises the question whether, as it has been said in the accompanying Editorial (2), the "renal denervation train" has been brought to a "grinding halt" (2) as far as its use for the treatment of resistant hypertension is concerned. The European Society of Hypertension believes that although in the Symplivity HTN-3 study use of an appropriate control group makes the results less open to confounders than those of previous studies, the conclusion that renal denervation is ineffective is not justified.

# In Summary

- Lots of evidence
  - but in both directions
- Lots of confusion
  - As always: more trials → more questions
- Still some freedom for individual decisions
  - Don't know for how long

# TRENDS 2015
